Summary

The M-4 carbine is the Army's primary individual combat weapon for infantry units. The M-4 uses a direct gas impingement system that blows carbon from the fired cartridge back into the weapon's receiver, which can lead to weapon malfunctions. The U.S. Special Operations Command (USSOCOM) is replacing its M-4s with the Special Operations Combat Assault Rifle (SCAR), a modular weapon with a short-stroke piston system that eliminates carbon blow back, which theoretically improves reliability. Some have questioned why the Army has not adopted the SCAR or another similarly designed weapon. A series of studies and tests of the M-4 and potential competitors have added to this debate, and the Army has taken steps to begin evaluating other weapons to replace the M-4. This report will be updated as events warrant.

Background

In the mid-1990s, the Army began fielding the M-4 carbine, a lighter, more compact version of the Vietnam-era M-16 rifle. Both M-16 and M-4 carbines are 5.56 mm caliber weapons and are primarily manufactured by Colt Defense LLC, Hartford, CT. Army officials are said to be satisfied with the M-16 family of weapons and have suggested that the M-16 is “simply too expensive to replace with anything less than a significant leap in technology.”¹ The Army’s “leap ahead” program to replace the M-16 family of weapons—the Objective Individual Combat Weapon (OICW) program—began in 1994, and one weapon evaluated in that program, Heckler & Koch’s XM-8 assault rifle, was considered by some as the M-16’s/M-4’s replacement. As late as 2005, the XM-8 was reportedly close to being officially approved as the Army’s new assault rifle, but alleged acquisition and bureaucratic conflicts compelled the Army to cancel the XM-8 in October 2005. The Army plans to continue its procurement of M-16s and M-4s for “years to come,” while some in Congress have called for an “open competition” to choose a successor to the M-16 and M-4 assault rifles.²

Concerns with M-4 Reliability and Lethality

Reports suggest that soldiers have expressed concerns regarding the reliability and lethality of the M-4.³ Reliability can be described as “the probability that an item can perform its intended function for a specified interval under stated conditions” and lethality as “the killing or stopping power of a bullet when fired from a weapon.”⁴

Center for Naval Analyses (CNA) Study on Small Arms in Combat⁵

In December 2006, the Center for Naval Analyses (CNA) published a survey and study at the request of the Army’s Project Manager-Soldier Weapons of 2,600 soldiers who had returned from Iraq and Afghanistan and who had engaged in a firefight using a variety of small arms. Some of the M-4-specific observations were as follows:

- Over 50% of soldiers using the M-4 and M-16 reported that they never experienced a stoppage [malfunction] while in theater, to include during training firing of the weapons (p. 2).
- Frequency of disassembled cleaning had no effect on the occurrences of stoppages. Variations in lubrication practices, such as the type of lubrication used

and the amount of lubrication applied, also had little effect on stoppages. Using a dry lubricant decreased reports for stoppages only for M-4 users (p. 3).

- Of soldiers surveyed who used the M-4, 89% reported being satisfied with their weapon (p. 11).
- Of M-4 users, 20% recommended a larger bullet for the M-4 to increase lethality (p. 30).
- Regarding M-16s and M-4s, many soldiers and experts in theater commented on the limited ability to effectively stop targets, saying that those personnel targets who were shot multiple times were still able to continue fighting (p. 29).

Although M-4 critics cite this report as evidence of unsuitability of the M-4, it might also be interpreted as a favorable report on the M-4's overall reliability and acceptance by soldiers. The "larger bullet" recommendation for lethality purposes may, in fact, be a valid recommendation based on observations from Iraq and Afghanistan, but the "bigger bullet debate" has been a source of contention for many small arms experts ever since the Army adopted the 5.56 mm M-16 during Vietnam in lieu of the 7.62 mm M-14 rifle.

Special Forces Opts to Replace the M-4⁶

In 2001, the U.S. Special Operations Command (USSOCOM) was said to have documented M-4 reliability problems in an official report, noting that the M-4 suffered from an "obsolete operating system" and recommending the redesign of the current gas system.⁷ The USSOCOM report allegedly described the M-4's shortened barrel and gas tube as a "fundamentally flawed" design, which contributed to failures extracting and ejecting spent cartridges during firing. In recognition of these deficiencies, the 1st Special Forces Operational Detachment-Delta, also referred to as "Delta Force," reportedly began working with German arms manufacturer Heckler & Koch to replace the M-4's gas system with a piston operating system to improve reliability and increase parts life. In 2004, Delta reportedly replaced their M-4s with the HK-416—a weapon that combines the operating characteristics of the M-4 with the piston operating system.⁸

In early 2003, USSOCOM officials initiated efforts to identify potential new combat rifle capabilities.⁹ From May through August 2004, USSOCOM evaluated 12 weapons from nine different manufacturers.¹⁰ In November 2004, USSOCOM awarded a contract to FNH USA¹¹ to develop the Special Operations Combat Assault Rifle (SCAR).¹² The SCAR will come in two variants—the heavy 7.62 mm SCAR-H and the light 5.56 mm SCAR-L.¹³ Each variant will

accommodate three different barrels—a standard 35.7 cm barrel, a 25.5 cm close-combat barrel, and a sniper variant barrel. All barrels reportedly will take less than five minutes to switch. The SCAR-L is intended to replace USSOCOM M4-A1 carbines and features the same type of gas piston operating system that the HK 416 employs.

U.S. Army Rangers to Employ SCAR in Combat¹⁴

In April 2009, the first 600 of 1,800 SCARs to be issued to USSOCOM were fielded to units of the 75th Ranger Regiment, and reports suggest that the Rangers will deploy into combat with the SCAR. Because this is the first known large-scale deployment of this weapon into combat, there will likely be a significant amount of evaluation of the SCAR's reliability and performance. These evaluations may prove useful to the Army as it examines the future of small arms.

Army's Asymmetric Warfare Group and the H&K-416

The Army describes the Asymmetric Warfare Group (AWG), based in Ft. Meade, MD, as an Army special missions unit consisting of carefully selected military, Department of the Army Civilians, and contractors who “observe and collect information about the evolving asymmetric operating environment by providing advisors to deployed and deploying forces in support in the Global War on Terrorism.”¹⁵ The Army reportedly initially approved AWG acquisition and use of HK-416s in lieu of M-4s, but then reversed this decision stating, “The AWG also advises units on training, tactics, and procedures. In this capacity, the use of the standard issue M-4 is required. In support of this mission set, the decision was made to transition to the M-4 and the AWG is now turning in its H&K rifles.”¹⁶ A report maintains that AWG “fought to keep its several hundred 416s, arguing that they outperform the Army's M-4 and require far less maintenance.” Because the HK-416 operates in a similar fashion to the M-4 and has comparable performance characteristics, it is unlikely that training, tactics, and procedures vary greatly between the two weapons, thereby causing some to question the motives behind the Army's decision to recall the AWG's HK-416s.

M-4 Reliability Testing

A 2002 Marine Corps Systems Command test was said to have concluded that the M-4 malfunctioned three times more often than the M-16A4, as the M-4 failed 186 times for a variety of reasons over the course of 69,000 rounds fired, while the M-16A4 failed 61 times.¹⁷ In a test conducted by the Army between October 2005 and April 2006, 10 new M-16s and 10 new M-4s

were fired in a 35,000-round test under laboratory conditions, with both weapons firing approximately 5,000 rounds between stoppages.

Congressionally Requested M-4 Test

In April 2007, Senator Tom Coburn (R-Oklahoma) sent a letter to then Acting Secretary of the Army Peter Geren questioning why the Army planned to spend \$375 million on M-4 carbines through FY2009 “without considering newer and possibly better weapons available on the commercial market.”¹⁸ Senator Coburn’s letter also cited M-4 reliability and lethality concerns and called for a competition to evaluate alternatives to the M-4, citing a need to conduct a “free and open competition.” The Army initially agreed to begin the tests in August 2007 at the Army Test and Evaluation Center at Aberdeen Proving Ground, MD, but then postponed the test until December 2007.¹⁹ The test evaluated the M-4 against the HK-416, the HK -XM8, and the FNH SCAR, with each weapon firing 6,000 rounds under sandstorm conditions. Officials reportedly evaluated 10 each of the four weapons, firing a total of 60,000 rounds per model resulting in the following: XM-8, 127 stoppages; FNH SCAR, 226 stoppages; HK-416, 233 stoppages; and the M-4, 882 stoppages.²⁰ On December 17, 2007, when the Army briefed Congress and the press, the Army reportedly claimed that the M-4 suffered only 296 stoppages during the test, explaining that the stoppage discrepancy from the original 882 M-4 stoppages reported could have been due to the application of the Army Test and Evaluation Center’s post-test Reliability, Availability, and Maintainability (RAM) Scoring Conference.²¹ This process attributes failures to such factors as operator error or part failure and, as an example, if evaluators linked 10 stoppages to a broken part on a weapon, they could eliminate nine of the stoppages and count only one failure for reporting purposes. It is not known whether the Army also applied the RAM process to the other three weapons in the test, but it might be assumed that if the other three weapons were given equal treatment, those weapon’s stoppages would also likely be decreased in a manner similar to the M-4.

U.S. Army Small Arms Capabilities-Based Assessment (CBA)²²

On January 21, 2009, the Secretary of the Army provided the House and Senate Armed Services Committees with the findings of the U.S. Army Infantry Center Small Arms Capabilities-Based Assessment (CBA), which had been completed in April 2008. The Army, as the Department of Defense (DOD) Executive Agent for Small Arms (SA), conducted the Small Arms CBA to establish and support a small arms acquisition strategy through 2015. This analysis examined 10 tasks, as described below:

1. Engage threat personnel with SA fire.
2. Engage threat personnel that are in defilade.²³

¹⁸ Information in this section is from Matthew Cox, “Competition Sought for New Army Rifle,” *Army Times*, April 27, 2007.

¹⁹ Matthew Cox, “Army Tests of Rival Carbines Postponed,” *Army Times*, September 20, 2007.

²⁰ Matthew Cox, “New Carbines Outperform M-4 in Dust Test,” *Army Times*, December 17, 2007.

²¹ Information in this section is from Matthew Cox, “Giving M-4 Failures an Alibi,” *Army Times*, December 29, 2007.

²² Information in this sections is from the U.S. Army Infantry Center Small Arms Capabilities Based Assessment provided to Congress on January 21, 2009.

3. Engage threats with precision SA fire.
4. Engage threats with SA volume fire.
5. Acquire personnel and vehicle targets.
6. Determine range to target.
7. Mark or tag targets.
8. Breach existing entry points.
9. Avoid detection caused by weapon signature.
10. Operate and maintain weapons.

Based on analysis, the study team identified 25 capability gaps associated with the 10 aforementioned tasks, as well the overall requirement from individual soldiers and their leaders that they required “greater lethality” and “more knockdown power.” The study team identified a number of non-material and material recommendations to address the identified capability gaps. Non-material solutions—which are preferable because they can be implemented relatively quickly and inexpensively—included improving training, updating doctrine, using additional SA ancillary devices (example: optics), developing a Small Arms Weapons Expert Program at battalion and brigade level, and adding a Weapons Repairman at company level. Material solutions included developing special airburst munitions to engage defilade targets; developing ammunition that would be more lethal at short ranges (0 to 200 meters); improving breaching and non-lethal marking 40 mm rounds; improving combat optics; developing a new weapon system for vehicle and aircraft crews that provides greater maneuverability in confined spaces and provides more firepower than a pistol; and developing SA weapons that require fewer and simpler tools to maintain and that would require less cleaning and lubrication. Another recommendation was that any new SA developed to meet these capability gaps needed to contribute to lightening the soldier’s overall combat load.

The study identified 42 separate Ideas for Material Solutions (IMAs) to address capability gaps that required a material solution. Of these 42 IMAs, 13 involved creating new munitions or improving existing munitions, and 10 involved aiming devices, optics, or laser designators; only 7 IMAs suggested modifying current SAs or developing new SAs. Other IMAs included suggestions such as improving munitions propellants and improving weapon magazines.

Secretary Geren’s January 21, 2009, letter to House and Senate Armed Service Committee Leadership stated that “following the completion of the CBA, the Army decided to update the requirement for combat rifle/ carbine and compete this updated requirement in an open competition.”

An Examination of the Small Arms Capability-Based Assessment

The Army’s SA CBA appears to be a comprehensive assessment of DOD’s small arms requirements that incorporates a great amount of analytical data and many observations derived

(...continued)

²³ Defilade is defined as protection provided from hostile fire provided by an obstacle such as a hill, ridge, or bank; a vertical distance by which a position is concealed from enemy observation; or to shield from enemy fire or observation by using natural or artificial obstacles.

from combat operations in Iraq and Afghanistan. It can be argued that the CBA does not present a compelling case to develop and acquire a new combat rifle or carbine. Many of the CBA's recommended material solutions involve improved or new munitions or ancillary items such as optics or weapons magazines. The CBA does call for the development of a new SA system for vehicle and aircraft crew and an extended-range heavy machine gun, but nowhere explicitly calls for a new combat rifle or carbine. It is possible that many of the CBA's proposed material solutions might be readily adaptable to current combat rifles (M-16s) and carbines (M-4s) with little or no modification to the weapon. In this regard, a totally new design might be required only if new munitions, optics, other ancillary items, and reliability improvements are totally incompatible with SAs currently in use. The majority of the deficiencies cited in the SA CBA do not directly fault the current combat rifle or carbine, but instead call for ammunition, sight, and optic improvements, which might not in and of themselves appear to justify undertaking a potentially lengthy and costly development and procurement effort.

Army Looks for a Replacement for the M-4²⁴

Based in part on the results of the Small Arms CBA, the Army issued a request for information in August 2008 to the small arms industry seeking information on "the state of the art in small arms technologies." This request is viewed by some as the first step in a carbine competition that the Army intends to conduct sometime in 2009 after Colt Defense turns over the M-4's technical data rights in June 2009. The Army plans to release a request for proposal (RFP) in the late summer of 2009 requesting prototype weapons for testing. Army officials have stated that they will consider other caliber weapons other than the current 5.56mm. Factors that the Army will consider in its evaluation are improved accuracy, durability in all environments, and modularity.

Department of Defense Conducts a Service-Wide Review of Small Arms²⁵

DOD is currently conducting a service-wide review of small arms requirements that some believe could "challenge the Army's decision to search for a new carbine."²⁶ This review involves small arms experts from each service as well as experts from the small arms industry and is intended to "map out a common strategy for the Defense Department's individual and crew-served weapons needs."²⁷ The DOD review team is currently said to be reviewing the Army's Small Arms CBA and was supposed to have developed a set of conclusions by the end of May 2009.

Potential Issues for Congress

DOD's Small Arms Review Versus the Army's Plan to Replace the M-4

As previously noted, the Army is basing its upcoming carbine competition to a large extent on the Small Arms CBA, which some believe does not present a compelling case to launch a competition to replace the M-4. According to reports, DOD—as part of its joint small arms review—is supposed to shortly reach a number of conclusions about the Army's Small Arms CBA that might be relevant to any planned M-4 replacement competition. The results of DOD's review might possibly support the Army's planned M-4 replacement competition or instead suggest an alternative course of action. Congress might benefit from examining the results of DOD's service-wide small arms review as it considers the future of the Army's small arms modernization efforts.

USSOCOM Implications of Replacing M-4s

It has been suggested that USSOCOM's decision to adopt the FNH SCAR has implications for the Army. In one sense, the SCAR is the first modular small arms system adopted by the military. The SCAR-L and SCAR-H will replace the following weapons: M-4A1, MK-18 close quarter carbine, MK-11 sniper security rifle, MK-12 special purpose rifle, and the M-14 rifle.²⁸ There is also a 90% parts commonality between the SCAR-L and SCAR-H, including a common upper receiver and stock and trigger housing and an enhanced grenade launcher can be attached to either model.²⁹ While the SCAR might not meet all of the conventional Army's requirements, its adaptability in terms of missions (close quarters combat to long-range sniper operations), being able to rapidly convert from a 5.56 mm to a 7.62 mm weapon, and the ability to accommodate a variety of modifications such as grenade launchers and special optics, might be factors worth considering as the "modular Army" plans future small arms programs. The Ranger's forthcoming combat deployment with the SCAR and associated lessons learned and performance and lethality data might also have implications for future Army small arms development and acquisition efforts.
