CRS Report for Congress
Prepared for Members and Committees of Congress

R11173008

Summary

Congressional interest in patent policy and possible patent reform has expanded as the importance of intellectual property to innovation has increased. Patent ownership is perceived as an incentive to the technological advancement that leads to economic growth. However, growing interest in patents has been accompanied by persistent concerns about the fairness and effectiveness of the current system. Several recent studies, including those by the National Academy of Sciences and the Federal Trade Commission, recommended patent reform to address perceived deficiencies in the operation of the patent regime. Other experts maintain that major alterations in existing law are unnecessary and that the patent process can adapt, and is adapting, to technological progress.

Patent reform proposals introduced in the 111th Congress would have worked significant legal changes to the patent system. Among the more notable of these proposed changes was a shift to a first-inventor-to-file priority system; substantive and procedural modifications to the patent law doctrine of willful infringement; and adoption of post-grant review proceedings, prior user rights, and pre-issuance publication of all pending applications. Several of these proposals have been the subject of discussion for many years, but others are more novel propositions.

Although the 111th Congress did not enact this broadly oriented legislation, it did enact P.L. 111-349 (H.R. 628). This law established a pilot program in certain U.S. district courts under which (1) the chief judge of the court designates district judges who request to hear cases involving patent or plant variety protection issues; (2) such cases are randomly assigned to district court judges, whether designated or not; (3) a non-designated judge may decline the case; and (4) a declined case is then randomly reassigned to a designated judge.

Additional legislative reform efforts in the previous Congress (H.R. 1260, S. 515, and S. 610) would have addressed several issues of concern, including the quality of issued patents, the expense and complexity of patent litigation, harmonization of U.S. patent law with the laws of our leading trading partners, potential abuses committed by patent speculators, and the special needs of individual inventors, universities, and small firms with respect to the patent system.

The provisions of the proposed legislation would arguably work the most sweeping reforms to the U.S. patent system since the 19th century. However, many of these proposals, such as pre-issuance publication and prior user rights, have already been implemented in U.S. law to a more limited extent. These and other reforms, such as the first-inventor-to-file priority system and post-grant review proceedings, also reflect the decades-old patent practices of Europe, Japan, and our other leading trading partners.

Some observers are nonetheless concerned that certain of these proposals would weaken patent rights, thereby diminishing incentives for innovation. Others believe that changes of this magnitude, occurring at the same time, do not present the most prudent course for the patent system. Patent reform therefore confronts Congress with difficult legal, practical, and policy issues, but also with apparent possibilities for altering and possibly improving the legal regime that has long been recognized as an engine of innovation within the U.S. economy.

Should patent reform legislation be subject to consideration in the 112th Congress, a separate report or reports will be issued.

Introduction

Congressional interest in patent reform has increased as the patent system becomes more significant to U.S. industry.¹ There is broad agreement that more patents are sought and enforced than ever before; that the attention paid to patents in business transactions and corporate boardrooms has dramatically increased; and that the commercial and social significance of patent grants, licenses, judgments, and settlements is at an all-time high.² As the United States becomes even more of a high-technology, knowledge-based economy, the importance of patents may grow even further in the future.

Increasing interest in patents has been accompanied by persistent concerns about the fairness and effectiveness of the current system. The passage of the American Inventors Protection Act in the 106th Congress made several changes to the patent laws, including U.S. Patent and Trademark Office (USPTO) publication of certain patent applications prior to grant and patent term restoration for delays caused by the USPTO during grant proceedings.³ Several studies completed since the enactment of that legislation, including those by the National Academy of Sciences and the Federal Trade Commission, have recommended additional legal reforms to address perceived deficiencies in the operation of the patent regime.⁴ Other experts maintain that major alterations in existing law are unnecessary and that the patent process can adapt, and is adapting, to technological progress.

In the 111th Congress, three bills were introduced that attempted to respond to current concerns about the functioning of the patent process. H.R. 1260, S. 515, and S. 610 proposed significant legal reforms to the patent system. Among these reforms were a shift to a first-inventor-to-file priority system; substantive and procedural modifications to the doctrine of willful infringement; and adoption of assignee filing, post-grant review proceedings, and prior user rights. Several of these proposals have been the subject of discussion within the patent community for many years, but others present more novel propositions. This legislation was not enacted.

The 111th Congress did enact one bill relating to patent reform, H.R. 628. As P.L. 111-349, this legislation established a pilot program in certain U.S. district courts under which (1) the chief judge of the court designates district judges who request to hear cases involving patent or plant variety protection issues; (2) such cases are randomly assigned to district court judges, whether designated or not; (3) a non-designated judge may decline the case; and (4) a declined case is then randomly reassigned to a designated judge.

¹ This report is based substantially on two predecessors, CRS Report RL32996, *Patent Reform: Innovation Issues*, and CRS Report RL33996, *Patent Reform in the 110th Congress: Innovation Issues*, that addressed patent reform issues in the 109th and 110th Congresses respectively.

² Statistics from the United States Patent and Trademark Office (USPTO) support this account. In 1980, the USPTO received 104,329 utility patent applications; by 2007, this number had grown to 456,154 applications. The number of U.S. utility patents granted in 1980 was 61,819; in 2007 this number had increased to 157,283. U.S. Patent and Trademark Office, *U.S. Patent Statistics, Calendar Years 1963-2007*, available at http://www.uspto.gov/web/offices/ac/ido/oeip/taf/us_stat.pdf.

³ The American Inventors Protection Act of 1999, P.L. 106-113, was part of the Intellectual Property and Communications Omnibus Reform Act of 1999, attached by reference to the Consolidated Appropriations Act for Fiscal Year 2000. President Clinton signed this bill on November 29, 1999.

⁴ National Research Council, National Academy of Sciences, *A Patent System for the 21st Century* [Washington, National Academies Press, 2004] and Federal Trade Commission, *To Promote Innovation: The Proper Balance of Competition and Patent Law and Policy*, October 2003, available at <http://www.ftc.gov>.

This study provides an overview of current patent reform issues. It begins by offering a summary of the structure of the current patent system and the role of patents in innovation policy. The report then reviews some of the broader issues and concerns, including patent quality, the high costs of patent litigation, international harmonization, and speculation in patents, that have motivated these diverse legislative reform proposals. The specific components of this legislation are then identified and reviewed in greater detail.

Patents and Innovation Policy

The Mechanics of the Patent System

The patent system is grounded in Article I, Section 8, Clause 8 of the U.S. Constitution, which states that “The Congress Shall Have Power ... To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries....” As mandated by the Patent Act of 1952,⁵ U.S. patent rights do not arise automatically. Inventors must prepare and submit applications to the U.S. Patent and Trademark Office (USPTO) if they wish to obtain patent protection.⁶ USPTO officials known as examiners then assess whether the application merits the award of a patent.⁷ The patent acquisition process is commonly known as “prosecution.”⁸

In deciding whether to approve a patent application, a USPTO examiner will consider whether the submitted application fully discloses and distinctly claims the invention.⁹ In addition, the application must disclose the “best mode,” or preferred way, that the applicant knows to practice the invention.¹⁰ The examiner will also determine whether the invention itself fulfills certain substantive standards set by the patent statute. To be patentable, an invention must consist of a process, machine, manufacture, or composition of matter that is useful, novel and nonobvious. The requirement of usefulness, or utility, is satisfied if the invention is operable and provides a tangible benefit.¹¹ To be judged novel, the invention must not be fully anticipated by a prior patent, publication or other state-of-the-art knowledge that is collectively termed the “prior art.”¹² A nonobvious invention must not have been readily within the ordinary skills of a competent artisan at the time the invention was made.¹³

If the USPTO allows the patent to issue, the patent proprietor obtains the right to exclude others from making, using, selling, offering to sell or importing into the United States the patented invention.¹⁴ Those who engage in these acts without the permission of the patentee during the

term of the patent can be held liable for infringement. Adjudicated infringers may be enjoined from further infringing acts.¹⁵ The patent statute also provides for the award of damages “adequate to compensate for the infringement, but in no event less than a reasonable royalty for the use made of the invention by the infringer.”¹⁶

The maximum term of patent protection is ordinarily set at 20 years from the date the application is filed.¹⁷ At the end of that period, others may employ that invention without regard to the expired patent.

Patent rights are not self-enforcing. Patentees who wish to compel others to observe their rights must commence enforcement proceedings, which most commonly consist of litigation in the federal courts. Although issued patents enjoy a presumption of validity, accused infringers may assert that a patent is invalid or unenforceable on a number of grounds.¹⁸ The U.S. Court of Appeals for the Federal Circuit (Federal Circuit) possesses national jurisdiction over most patent appeals from the district courts.¹⁹ The U.S. Supreme Court enjoys discretionary authority to review cases decided by the Federal Circuit.²⁰

Innovation Policy

Most experts agree that patent ownership is an incentive to innovation, the basis for the technological advancement that contributes to economic growth. It is through the commercialization and use of new products and processes that productivity gains are made and the scope and quality of goods and services are expanded. Award of a patent is intended to stimulate the investment necessary to develop an idea and bring it to the marketplace embodied in a product or process. Patent title provides the recipient with a limited-time monopoly over the use of his discovery in exchange for the public dissemination of information contained in the patent application. This is intended to permit the inventor to receive a return on the expenditure of resources leading to the discovery but does not guarantee that the patent will generate commercial benefits. The requirement for publication of the patent is expected to stimulate additional innovation and other creative means to meet similar and expanded demands in the marketplace.

Innovation produces new knowledge. One characteristic of this knowledge is that it is a “public good,” a good that is not consumed when it is used. This “public good” concept underlies the U.S. patent system. Absent a patent system, “free riders” could easily duplicate and exploit the inventions of others. Further, because they incurred no cost to develop and perfect the technology involved, copyists could undersell the original inventor. The resulting inability of inventors to capitalize on their inventions would lead to an environment where too few inventions are made.²¹

¹⁵ 35 U.S.C. § 283.

¹⁶ 35 U.S.C. § 284.

¹⁷ 35 U.S.C. § 154(a)(2). Although patent term is based upon the filing date, the patentee gains no enforceable legal rights until the USPTO allows the application to issue as a granted patent. A number of Patent Act provisions may modify the basic 20-year term, including examination delays at the USPTO and delays in obtaining marketing approval for the patented invention from other federal agencies.

²¹ See Rebecca S. Eisenberg, “Patents and the Progress of Science: Exclusive Rights and Experimental Use,” 56 *University of Chicago Law Review* 1017 (1989).

The patent system corrects this market failure problem by providing innovators with an exclusive interest in their inventions for a period of time, thereby allowing them to capture the innovation's marketplace value.

The regime of patents purportedly serves other goals as well. The patent system encourages the disclosure of products and processes, for each issued patent must include a description sufficient to enable skilled artisans to practice the patented invention.²² At the close of the patent's 20-year term,²³ others may practice the claimed invention without regard to the expired patent. In this manner the patent system ultimately contributes to the growth of the public domain.

Even during their term, issued patents may also encourage others to "invent around" the patentee's proprietary interest. A patentee may point the way to new products, markets, economies of production and even entire industries. Others can build upon the disclosure of a patent instrument to produce their own technologies that fall outside the exclusive rights associated with the patent.²⁴

The patent system has also been identified by legal observers as a facilitator of markets. Absent patent rights, an inventor may have scant tangible assets to sell or license. In addition, an inventor might otherwise be unable to police the conduct of a contracting party. Any technology or know-how that has been disclosed to a prospective licensee might be appropriated without compensation to the inventor. The availability of patent protection decreases the ability of contracting parties to engage in opportunistic behavior. By lowering such transaction costs, the patent system may make technology-based transactions more feasible.²⁵

Through these mechanisms, the patent system can provide more socially desirable results than its chief legal alternative, trade secret protection. Trade secrecy guards against the improper appropriation of valuable, commercially useful and secret information. In contrast to patenting, trade secret protection does not result in the disclosure of publicly valuable information. That is because an enterprise must take reasonable measures to keep secret the information for which trade secret protection is sought. Taking the steps necessary to maintain secrecy, such as implementing physical security measures, also imposes costs that may ultimately be unproductive for society.²⁶

The patent system has long been subject to criticism, however. Some observers have asserted that the patent system is unnecessary due to market forces that already suffice to create an optimal level of innovation. The desire to obtain a lead time advantage over competitors, as well as the recognition that technologically backward firms lose out to their rivals, may well provide sufficient inducement to invent without the need for further incentives.²⁷ Other commentators believe that the patent system encourages industry concentration and presents a barrier to entry in some markets.²⁸ Still other observers believe that the patent system too frequently attracts

speculators who prefer to acquire and enforce patents rather than engage in socially productive activity.²⁹

When analyzing the validity of these competing views, it is important to note the lack of rigorous analytical methods available for studying the effect of the patent law upon the U.S. economy as a whole. The relationship between innovation and patent rights remains poorly understood. As a result, current economic and policy tools do not allow us to calibrate the patent system precisely in order to produce an optimal level of investment in innovation. Thus, each of the arguments for and against the patent system remains open to challenge by those who are not persuaded by their internal logic.

Current Issues and Concerns

Legislation introduced in the 111th Congress—H.R. 1260, S. 515, and S. 610, each titled the Patent Reform Act of 2009—proposed a number of changes to diverse aspects of the patent system. Although these reforms were undoubtedly motivated by a range of concerns, a discrete number of issues have been the subject of persistent discussion in the patent community over a period of many years. Among these issues are concern for the quality of issued patents, the expense and complexity of patent litigation, harmonization of U.S. patent law with the laws of our leading trading partners, potential abuses committed by patent speculators, and the special needs of individual inventors, universities, and small firms with respect to the patent system. In addition, although the patent statute in large measure applies the same basic rules to different sorts of inventions, regardless of the technological field of that invention, the patent system is widely believed to impact different industries in varying ways.³⁰ As a result, different industries can be expected to espouse dissimilar views of certain patent reform proposals. Before turning to a more specific analysis of individual legislative proposals, this report reviews the proposed legislation's broader themes with regard to these issues and concerns.

Patent Quality

Government, industry, academia and the patent bar alike have long insisted that the USPTO approve only those patent applications that describe and claim a patentable advance.³¹ Because they meet all the requirements imposed by the patent laws, quality patents may be dependably enforced in court and employed as a technology transfer tool. Such patents are said to confirm private rights by making their proprietary uses, and therefore their value, more predictable. Quality patents also may clarify the extent that others may approach the protected invention

³¹ CRS Report RL31281, *Patent Quality and Public Policy: Issues for Innovative Firms in Domestic Markets*, by John R. Thomas.

without infringing. These traits in turn should strengthen the incentives of private actors to engage in value-maximizing activities such as innovation or commercial transactions.³²

In contrast, poor patent quality is said to create deleterious consequences. Large numbers of inappropriately granted patents may negatively impact entrepreneurs. For example, innovative firms may be approached by an individual with a low quality patent that appears to cover the product they are marketing. The innovative firm may recognize that the cost of challenging a patent even of dubious validity may be considerable. Therefore, the firm may choose to make payments under licensing arrangements, or perhaps decide not to market its product at all, rather than contest the patent proprietor's claims.³³

Poor patent quality may also encourage opportunistic behavior. Perhaps attracted by large damages awards and a potentially porous USPTO, rent-seeking entrepreneurs may be attracted to form speculative patent acquisition and enforcement ventures. Industry participants may also be forced to expend considerable sums on patent acquisition and enforcement.³⁴ The net results would be reduced rates of innovation, decreased patent-based transactions, and higher prices for goods and services.

Although low patent quality appears to affect both investors and competitors of a patentee, patent proprietors themselves may also be negatively impacted. Patent owners may make managerial decisions, such as whether to build production facilities or sell a product, based upon their expectation of exclusive rights in a particular invention. If their patent is declared invalid by the USPTO or a court, patentees will be stripped of exclusive rights without compensation. The issuance of large numbers of invalid patents would increase the possibility that the investment-backed expectations of patentees would be disappointed.³⁵

The notion that high patent quality is socially desirable has been challenged, however. Some commentators believe that market forces will efficiently assign patent rights no matter what their quality. Others observe that few issued patents are the subject of litigation and further estimate that only a minority of patents are licensed or sold. Because many patented inventions are not used in a way that calls their validity into question, some observers maintain, society may be better off making a detailed review into the patentability of an invention only in those few cases where that invention is of commercial significance.³⁶

During the 111th Congress, legislation left pending addressed the patent quality issue. H.R. 1260, S. 515, and S. 610 each allowed for increased public participation in USPTO decision-making through a pre-issuance submission procedure. These bills also permitted post-issuance review proceedings, which would potentially allow interested parties to “weed out” invalid patents before they are the subject of licensing or infringement litigation.

Litigation Costs

Patent enforcement is often expensive. The complex legal and technological issues, extensive discovery proceedings, expert witnesses, and specially qualified attorneys associated with patent trials can lead to high costs.³⁷ One study published in 2000 concluded that the average cost of patent enforcement was \$1.2 million.³⁸ These expenses appear to be increasing, with one more recent commentator describing an “industry rule of thumb” whereby “any patent infringement lawsuit will easily cost \$1.5 million in legal fees alone to defend.”³⁹ Higher stakes litigation is even more costly according to a 2008 American Intellectual Property Law Association study: for patent suits involving damages claims of more than \$25 million, expenses reportedly increased in 2007 to \$5 million.⁴⁰

For innovative firms that are not infrequently charged with patent infringement, or that bring claims of patent infringement themselves, the annual expenses associated with patent litigation can be very dear. The Microsoft Corporation reportedly defends an average of 35 to 40 patent lawsuits annually at a cost of almost \$100 million.⁴¹ The Intel Corporation has recently been estimated to spend \$20 million a year on patent litigation.⁴²

The high costs of litigation may discourage patent proprietors from bringing meritorious claims against infringers. They may also encourage firms to license patents of dubious merit rather than contest them in court. H.R. 1260 and S. 515 would have endeavored to make patent litigation less costly and complex through modification of the doctrine of willful infringement. These two bills also allowed for an interlocutory appeal of claim construction rulings by the district courts. In addition, all three bills—H.R. 1260, S. 515, and S. 610—called for an administrative post-grant review proceeding that could serve as a less expensive alternative to litigation. In addition, P.L. 111-349 established a pilot program that might potentially place more patent cases before jurists experienced in this discipline—a circumstance that might decrease litigation costs.

International Harmonization

In the increasingly globalized, high-technology economy, patent protection in a single jurisdiction is often ineffective to protect the interests of inventors. As a result, U.S. inventors commonly seek patent protection abroad. Doing so can be a costly, time-consuming, and difficult process. There is no global patent system. Inventors who desire intellectual property protection in a particular country must therefore take specific steps to procure a patent within that jurisdiction.⁴³

Differences in national laws are among the difficulties faced by U.S. inventors seeking patent rights overseas. Although the world's patent laws have undergone considerable harmonization in recent years, several notable distinctions between U.S. patent law and those of our leading trading partners persist. H.R. 1260, S. 515, and S. 610 addressed some of these differences by modifying U.S. patent law in order to comply with international standards. Among these proposed reforms are adoption of a first-inventor-to-file priority system, a post-grant review system, and assignee filing.

Potential Abuses by Patent Speculators

Some commentators believe that the patent system too frequently attracts speculators who prefer to acquire and enforce patents rather than engage in research, development, manufacturing, or other socially productive activity.⁴⁴ Patent speculators are sometimes termed “trolls,” after creatures from folklore that would emerge from under a bridge in order to waylay travelers.⁴⁵ The late Jerome C. Lemelson, a prolific inventor who owned hundreds of patents and launched numerous charges of patent infringement, has sometimes been mentioned in this context. The total revenue of the Lemelson estate's patent licensing program has been reported as in excess of \$1.5 billion.⁴⁶ But as explained by journalist Michael Ravnitzky, “critics charge that many Lemelson patents are so-called submarine patents, overly broad applications that took so long to issue or were so general in nature that their owners could unfairly claim broad infringement across entire industry sectors.”⁴⁷ Of such patent ventures, patent attorney James Pooley observes:

Of course there is nothing inherently wrong with charging someone rent to use your property, including intellectual property like patents. But it's useful to keep in mind—especially when listening to prattle about losing American jobs to foreign competition—that these patent mills produce no products. Their only output is paper, of a highly threatening sort.⁴⁸

Patent enforcement suits brought by patent speculators appear to present special concerns for manufacturers and service providers. If one manufacturer or service provider commences litigation against another, the defendant can often assert its own claims of patent infringement against the plaintiff. Because patent speculators do not otherwise participate in the marketplace, however, the defendant is unable to counter with its own patent infringement charges. This asymmetry in litigation positions reportedly reduces the bargaining power of manufacturers and service providers, potentially exposing them to harassment.⁴⁹

Observers hasten to note, however, that not every patent proprietor who does not commercialize the patented invention should properly be considered an opportunistic “troll.” A nonmanufacturing patentee may lack the expertise or resources to produce a patented product, prefer to commit itself to further innovation, or otherwise have legitimate reasons for its

behavior.⁵⁰ Universities and small biotechnology companies often fit into this category. Further, whether classified as a “troll” or not, each patent owner has presumptively fulfilled all of the relevant statutory requirements. Among these obligations is a thorough disclosure of a novel, nonobvious invention to the public.⁵¹

The legislation introduced in the 111th Congress would have impacted concerns over “trolling” by the introduction of post-grant review procedures and reform of patent damages law.

The Role of Individuals, Universities, and Small Entities

Entrepreneurs and small, innovative firms play a role in the technological advancement and economic growth of the United States.⁵² Several studies commissioned by U.S. federal agencies have concluded that individuals and small entities constitute a significant source of innovative products and services.⁵³ Studies have also indicated that entrepreneurs and small, innovative firms rely more heavily upon the patent system than larger enterprises. Larger companies are said to possess alternative means for achieving a proprietary or property-like interest in a particular technology. For example, trade secrecy, ready access to markets, trademark rights, speed of development, and consumer goodwill may to some degree act as substitutes to the patent system.⁵⁴ However, individual inventors and small firms often do not have these mechanisms at their disposal. As a result, the patent system may enjoy heightened importance with respect to these enterprises.⁵⁵

In recent years, universities have also become more full-fledged participants in the patent system. This trend has been attributed to the Bayh-Dole Act,⁵⁶ a federal statute that allowed universities and other government contractors to retain patent title to inventions developed with the benefit of federal funding.⁵⁷ In recent years there has reportedly “been a dramatic increase in academic institutions’ investments in technology licensing activities.”⁵⁸ This increase has been reflected in

the growth in the number of patents held by universities, the number of universities with technology transfer offices, and the amount of patent-based licensing revenues that these offices have raised.⁵⁹

The U.S. patent system has long acknowledged the role, and particular needs, of independent inventors, small firms, and universities. For example, the patent statute calls for each of these entities to receive a 50% discount on many USPTO fees.⁶⁰ As the USPTO is currently entirely funded by the fees it charges its users,⁶¹ this provision effectively calls for larger institutions to subsidize the patent expenditures of their smaller competitors.

Beyond potentially diminished financial resources vis-à-vis larger concerns, however, observers have disagreed over whether independent inventors, small firms, and universities have particular needs with respect to the patent system, and if so whether those needs should be reflected in patent law doctrines. For example, with respect to the proposed system of “prior user rights,”⁶² some observers state that such rights would particularly benefit small entities, which may often lack a sophisticated knowledge of the patent system.⁶³ Others disagree, stating that smaller concerns rely heavily on the exclusivity of the patent right, and that the adoption of prior user rights would advantage large enterprises.⁶⁴ Similar debates have occurred with respect to other patent reform proposals, perhaps reflecting the fact that the community of independent inventors, small firms, and universities is itself a diverse one.

Legislation left pending in the 111th Congress included a number of provisions that appear to be of particular interest to independent inventors, universities, and small businesses, including a shift to a first-inventor-to-file priority system and post-grant review procedures.

Differing Patent Values in Distinct Industries

To a large extent, the patent statute subjects all inventions to the same standards, regardless of the field in which those inventions arose. Whether the invention is an automobile engine, semiconductor, or a pharmaceutical, it is for the most part subject to the same patentability requirements, scope of rights, and term of protection. Both experience and economic research suggest that distinct industries encounter the patent system in different ways, however. As a

⁶⁰ 35 U.S.C. § 41(g).

⁶¹ CRS Report RS20906, *U.S. Patent and Trademark Office Appropriations Process: A Brief Explanation*, by Wendy H. Schacht.

⁶² Under a rule of “prior user rights,” when a conflict exists between an issued patent and an earlier user of the patented technology, the validity of the patent is upheld but the prior user is exempted from infringement. See Pierre Jean Hubert, “The Prior User Right of H.R. 400: A Careful Balancing of Competing Interests,” 14 *Santa Clara Computer and High Technology Law Journal* (1998), 189. Prior user rights are discussed further in this report below.

⁶³ See Gary L. Griswold & F. Andrew Ubel, “Prior User Rights—A Necessary Part of a First-to-File System,” 26 *John Marshall Law Review* (1993), 567.

⁶⁴ See David H. Hollander, Jr., “The First Inventor Defense: A Limited Prior User Right Finds Its Way Into U.S. Patent Law,” 30 *American Intellectual Property Law Association Quarterly Journal* (2002), 37 (noting the perception that prior user rights favor large, well-financed corporations).

result, it can be expected that particular industries will react differently to the various patent reform proposals currently before Congress.⁶⁵

Studies suggest that different industries attach widely varying values to patents. For example, one analysis of the aircraft and semiconductor industries suggested that lead time and the strength of the learning curve were superior to patents in capturing the value of investments.⁶⁶ In contrast, members of the drug and chemical industries attach a higher value to patents where patents are considered the most effective method to protect inventions, particularly when biotechnology is included.⁶⁷ Among the reasons for these divergent assessments are “the cost of research and development (especially in relation to imitation costs), the technological risk associated with such research, and the availability of effective non-patent means of protection.”⁶⁸

Although broad generalizations should be drawn with care, two industries widely perceived as utilizing the patent system in different ways are the pharmaceutical and software sectors. Within the pharmaceutical industry, individual patents are perceived as critical to a business model that provides life-saving and life-enhancing medical innovations, but eventually allows members of the public access to medicines at low cost. In particular, often only a handful, and sometimes only one or two patents cover a particular drug product, therefore “the relative value per patent is much higher in the lifesciences.”⁶⁹ Patents are also judged to be crucial to the pharmaceutical sector because of the large R&D investments associated with bringing a drug to market, as well as the relative ease of replicating the finished product. For example, while it is expensive, complicated, and time consuming to duplicate an airplane, it is relatively simple to perform a chemical analysis of a pill and reproduce it.⁷⁰

In contrast to the pharmaceutical field, the nature of software development is such that innovations are typically cumulative and new products often embody numerous patentable inventions. This environment has led to what has been described as a

poor match between patents and products in the [software] industry: it is difficult to patent an entire product in the software industry because any particular product is likely to include dozens if not hundreds of separate technological ideas.⁷¹

This situation may be augmented by the multiplicity of patents often associated with a finished computer product that utilizes the software. It is not uncommon for thousands of different patents (relating to hardware and software) to be embodied in one single computer. In addition,

ownership of these patents may well be fractured among hundreds or thousands of different individuals and firms.

In general, the patent laws provide a “one size fits all” system, where all inventions are subject to the same requirements of patentability and scope of protection, regardless of the technical field in which they arose. Innovators in different fields nonetheless have varying experiences with the patent system. The differing valuation of patents among sectors leads to the expectation that distinct industries may react differently to the various patent reform proposals presently being considered by Congress, particularly the issue of the apportionment of damages.

Proposed Legislative Initiatives

Legislation was introduced in both houses of Congress that proposed significant reforms to the patent system. With respect to the House of Representatives, H.R. 1260, titled the Patent Reform Act of 2009, was introduced on March 3, 2009. S. 515 and S. 610, each also titled the Patent Reform Act of 2009, were introduced in the Senate on March 3, 2009 and March 17, 2009, respectively. S. 515 was reported, amended, from the Senate Committee on the Judiciary on April 2, 2009. It was then subject to a Manager’s Amendment on March 4, 2010. None of these bills were enacted. For purposes of comparison, the following chart identifies the significant proposals of these bills.

H.R. 1260	S. 515 As reported	S. 515 Manager’s Amendment	S. 610
First Inventor to File, § 3	First Inventor to File, § 2	First Inventor to File, § 2	First Inventor to File, § 2
Grace Period, § 3	Grace Period, § 2	Grace Period, § 2	Grace Period, § 2

			Applicant Quality Submissions, § 10
			Inequitable Conduct, § 11
			Conversion of Deadlines, § 12
			Check Imaging Patents, § 13
			USPTO Funding, § 14

A number of differences exist between the earlier version of S. 515 and the subsequent Manager's Amendment. Among these differences are the introduction of the "supplemental examination" proceeding, removal of a proposal to require the Federal Circuit to accept interlocutory appeals of claim construction rulings, a reduction of USPTO fees for micro entities, changes to amendments regarding post-grant proceedings, and a codification of recent case law regarding willful infringement. References to S. 515 in subsequent portions of this report are to the Manager's Amendment.

First Inventor to File

S. 515 and S. 610 would have each shifted the U.S. patent priority rule from the current "first-to-invent" principle to the "first-inventor-to-file" principle.⁷² H.R. 1260 also would have shifted to the "first-inventor-to-file" principle,⁷³ provided that "the President transmits to the Congress a finding that major patenting authorities have adopted a grace period having substantially the same effect" as those within the bill.⁷⁴ The term "major patenting authorities" was defined as "at least the patenting authorities in Europe and Japan."⁷⁵

Within the patent law, the priority rule addresses the circumstance where two or more persons independently develop the identical or similar invention at approximately the same time. In such

⁷² S. 515, § 2; S. 610, § 2.

⁷³ H.R. 1260, § 3.

⁷⁴ *Id.* at § 3(k).

⁷⁵ *Id.* The European Patent Convention, which for nearly 30 years has provided the framework for European patent law, currently does not provide inventors with a generally applicable grace period during which they may publicly disclose their inventions without prejudice to their patent rights. See European Patent Convention, Art. 54, October 5, 1973, 13 I.L.M. 268. Under Japanese law, the grace period is six months. See Japanese Patent Act, Law No. 121 of 1959, art. 67-2-2. Under H.R. 1260, a U.S. shift to a first-inventor-to-file regime would require amendments to both of these laws, at a minimum.

cases the patent law must establish a rule as to which of these inventors obtains entitlement to a patent.⁷⁶ Under current U.S. law, when more than one patent application is filed claiming the same invention, the patent will be awarded to the applicant who was the first inventor in fact. This conclusion holds even if the first inventor was not the first person to file a patent application directed towards that invention.⁷⁷ Within this “first-to-invent” system,⁷⁸ the timing of real-world events, such as the date a chemist conceived of a new compound or a machinist constructed a new engine, is of significance.

In every patent-issuing nation except the United States, priority of invention is established by the earliest effective filing date of a patent application disclosing the claiming invention.⁷⁹ Stated differently, the inventor who first filed an application at the patent office is presumptively entitled to the patent. Whether or not the first applicant was actually the first individual to complete the invention in the field is irrelevant. This priority system follows the “first-inventor-to file” principle.

A simple example illustrates the distinction between these priority rules. Suppose that Inventor A synthesizes a new chemical compound on August 1, 2008, and files a patent application on November 1, 2008, claiming that compound. Suppose further that Inventor B independently invents the same compound on September 1, 2008, and files a patent application on October 1, 2008. Inventor A would be awarded the patent under the first-to-invent rule, while Inventor B would obtain the patent under the first-inventor-to-file principle.

Under the current U.S. first-to-invent rule, priority disputes may be resolved via “interference” proceedings conducted at the USPTO.⁸⁰ An interference is a complex administrative proceeding that may result in the award of priority to one of its participants. These proceedings are not especially common. One estimate concludes that less than one-quarter of one percent of patents are subject to an interference.⁸¹ This statistic may mislead, however, because the expense of interference cases may result in their use only for the most commercially significant inventions. A shift to a first-inventor-to-file priority rule would eliminate the need for interference proceedings. Instead, the applicant with the earliest filing date, rather than the first individual to have created the invention, would be eligible for the patent.

The relative merits of the first-to-invent and first-inventor-to-file priority principles have been the subject of a lengthy debate within the patent community. Supporters of the current first-to-invent principle in part assert that the first-inventor-to-file system would create inequities by sponsoring a “race to the Patent Office.” They are also concerned that the first-to-file system would encourage premature and sketchy technological disclosures in hastily filed patent applications.⁸²

⁷⁶ See Roger E. Schechter & John R. Thomas, *Principles of Patent Law* § 1.2.5 (2d ed. 2004).

⁷⁷ In addition, the party that was the first to invent must not have abandoned, suppressed or concealed the invention. 35 U.S.C. § 102(g)(2).

⁸² See Brad Pedersen & Vadim Braginsky, “The Rush to First-to-File Patent System in the United States: Is a Globally (continued...)”

Supporters of the first-inventor-to-file principle in part argue that it provides a definite, readily determined and fixed date of priority of invention, which would lead to greater legal certainty within innovative industries. They also contend that the first-inventor-to-file principle would decrease the complexity, length, and expense associated with current USPTO interference proceedings. Rather than being caught up in lengthy interference proceedings in an attempt to prove dates of inventive activity that occurred many years previously, they assert, inventors could continue to go about the process of innovation. Supporters also observe that informed U.S. firms already organize their affairs on a first-inventor-to-file basis in order to avoid forfeiture of patent rights abroad.⁸³

The debate over a shift to the first-inventor-to-file rule upon individual inventors, small firms, and universities is contentious. Some observers state that such entities often possess fewer resources and wherewithal than their larger competitors, and thus are less able to prepare and file patent applications quickly. Others disagree, stating that smaller concerns are more nimble than larger ones and thus better able to submit applications promptly. They also point to the availability of provisional applications,⁸⁴ asserting that such applications allow small entities to secure priority rights readily without a significant expenditure of resources. A quantitative study of interference proceedings by Gerald Mossinghoff, a former Commissioner of the USPTO, also suggested that the first-to-invent rule neither advantaged nor disadvantaged small entities vis-à-vis larger enterprises.⁸⁵

Whether the U.S. Constitution places restraints upon the selection of a patent priority principle has also been debated. Article I, Section 8, clause 8 of the Constitution provides Congress with the authority to award “inventors” with exclusive rights. Some observers assert this language suggests, or possibly even mandates, the current first-to-invent system.⁸⁶ Others conclude that because the first-inventor-to-file only awards patents to individuals who actually developed the invention themselves, rather than derived it from another, this priority system is permissible under the Constitution.⁸⁷

In weighing the validity of this position, it should be noted that under well-established U.S. law, the first-inventor-in-fact does not always obtain entitlement to a patent. If, for example, a first-inventor-in-fact maintained his invention as a trade secret for many years before seeking patent protection, he may be judged to have “abandoned, suppressed, or concealed” the invention.⁸⁸ In such a case a second-inventor-in-fact may be awarded a patent on that invention. Courts have reasoned that this statutory rule encourages individuals to disclose their inventions to the public

⁸⁸ 35 U.S.C. § 102(g)(2).

promptly, or give way to an inventor who in fact does so.⁸⁹ As the first-inventor-to-file rule acts in a similar fashion to this longstanding patent law principle, conflict between this rule and the Constitution appears unlikely.

Notably, a first-inventor-to-file priority rule does not permit one individual to copy another's invention and then, by virtue of being the first to file a patent application, be entitled to a patent. All patent applicants must have originated the invention themselves, rather than derived it from another.⁹⁰ In order to police this requirement, both bills would provide for "inventor's rights contests" that would allow the USPTO to determine which applicant is entitled to a patent on a particular invention.⁹¹

Grace Period

Current U.S. patent law essentially provides inventors with a one-year period to decide whether patent protection is desirable, and, if so, to prepare an application. Specified activities that occur before the "critical date"—patent parlance for the day one year before the application was filed—will prevent a patent from issuing.⁹² If, for example, an entrepreneur first discloses an invention by publishing an article in a scientific journal, she knows that she has one year from the publication date in which to file a patent application. Importantly, uses, sales, and other technical disclosures by third parties will also start the one-year clock running. As a result, inventors have a broader range of concerns than merely their own activities.⁹³

Suppose, for example, that an electrical engineer files a patent application claiming a new capacitor on February 1, 2008. While reviewing the application, a USPTO examiner discovers an October 1, 2006, journal article by any author disclosing the identical capacitor. Because the article was published prior to the critical date of February 1, 2007, that publication will prevent or "bar" the issuance of a patent on that capacitor.

If a relevant reference is first publicly disclosed during the one-year grace period—that is to say, after the critical date but prior to the filing date—the legal situation is more complex. Under current law, patent applicants may "antodate" such a reference by demonstrating that they had actually invented the subject matter of their application prior to the date of the reference. If the applicant can make such a showing, then the reference cannot ordinarily be used to defeat the patentability of the invention.

As an illustration of this procedure, suppose that an inventor files a patent application directed to a polymer on February 1, 2008. Suppose further that the USPTO examiner discovers that a textbook published on January 1, 2008, describes the same polymer that is claimed in the application.⁹⁴ Because the textbook was published subsequent to the critical date of February 1, 2007, it does not absolutely bar the application. In order to obtain a patent, however, the applicant must nonetheless demonstrate that he invented the polymer prior to January 1, 2008, the date the

⁹³ Schechter & Thomas, *supra*, at § 4.3.1.

⁹⁴ In addition, the textbook must be attributable to someone other than the patent applicant. See 35 U.S.C. § 102(a).

textbook was published. The applicant might submit copies of his laboratory notebook, for example, or submit a sworn declaration in order to make this showing.⁹⁵

S. 515 and S. 610 would have changed, and H.R. 1260 could potentially have changed, the current grace period by causing it only to apply to patent applicants themselves. Under this proposal, “disclosures made by the inventor or a joint inventor or by others who obtained the subject matter disclosed directly or indirectly from the inventor or a joint inventor” would not be patent-defeating, provided they were made “one year or less before the effective filing date of the claimed invention.” In contrast, disclosures qualify as prior art, and are therefore potentially patent-defeating, if they were made either by (1) the inventors and their associates more than one year before the patent application’s filing date; or (2) anyone else prior to the filing date, provided that such a disclosure occurred prior to the inventor’s own disclosure. These amendments would, in essence, protect the patent positions of individuals who disclosed their inventions up to one year before they filed a patent application. The grace period would no longer shield inventors from earlier disclosures made by unrelated individuals, however.

Prior Art Definition

S. 515 and S. 610 eliminated three provisions of the Patent Act, paragraphs (c), (d), and (f) of Section 102, that concern the “prior art”—that is to say, events that will prevent an inventor from obtaining a patent.⁹⁶ Once more, H.R. 1260 would have made the same change, contingent upon the President’s certification that “major patenting authorities” provide inventors with a grace period having substantially the same effect as the one proposed in the legislation.⁹⁷

Section 102(c) prohibits an applicant from obtaining a patent when he “has abandoned the invention.” This statute does not refer to disposal of the invention itself, however, but instead to the intentional surrender of an invention *to the public*. Older Supreme Court opinions instruct that abandonment may occur where an inventor expressly dedicates it to the public, through a deliberate relinquishment or conduct evidencing an intent not to pursue patent protection.⁹⁸ The circumstances must be such that others could reasonably rely upon the inventor’s renunciation.⁹⁹ Perhaps because few individuals expressly cede their patentable inventions to the public without seeking compensation, there are few modern judicial opinions that consider 35 U.S.C. § 102(c) in any meaningful way. In addition, the generally applicable principle of equitable estoppel may apparently be used to obtain the same result.¹⁰⁰

Like Section 102(c), Section 102(d) of the Patent Act is reportedly little-used.¹⁰¹ 35 U.S.C. 102(d) bars award of a U.S. patent when (1) an inventor files a foreign patent application more than 12 months before filing the U.S. application, and (2) a foreign patent results from that application prior to the U.S. filing date. Suppose that an inventor files an application at a foreign patent office

¹⁰⁰ See generally *A.C. Auckerman & Co. v. R.L. Chaides Construction Co.*, 960 F.2d 1020 (Fed. Cir. 1992).

¹⁰¹ *Schechter & Thomas, supra*, at § 4.3.8.

on May 25, 2007. The foreign application matures into a granted foreign patent on August 1, 2008. If the inventor has not filed his patent application at the USPTO as of August 1, 2008, the date of the foreign patent grant, any patent application that the inventor subsequently filed in the United States would be defeated.

35 U.S.C. § 102(d) is intended to encourage the prompt filing of patent applications in the United States. As the Patent Office Commissioner explained in 1870:

The intention of [C]ongress obviously was to obtain for this country the free use of the inventions of foreigners as soon as they became free abroad. This is indicated by the use of the phrase, ‘first patented, or caused to be patented, in a foreign country,’ for it was presumable that American citizens would obtain their first patent here, while a foreigner would first patent his invention in his own country. The statute was designed to prevent a foreigner from spending his time and capital in the development of an invention in his own country, and then coming to this country to enjoy a further monopoly, when the invention had become free at home. The result of such a course would be that while the foreign country was developing the invention and enjoying its benefits, its use could be interdicted here; while, if the term of the monopoly could be further extended here, the market could be controlled long after the foreign nation was prepared to flood this country with the unpatented products of the patented process.¹⁰²

Section 102(d) has been subject to critical commentary. Because inventors may choose to file a patent application only in the United States, the policy goal of assuring that the U.S. market will become patent-free contemporaneously with foreign markets may not be well-served by this provision. In addition, 35 U.S.C. § 102(d) effectively acts against foreign, rather than U.S.-based inventors, as domestic inventors ordinarily file at the USPTO first before seeking rights overseas. Some commentators have suggested that 35 U.S.C. § 102(d) violates the spirit, if not the letter, of U.S. international treaty obligations, which generally impose an obligation of national treatment with respect to intellectual property matters.¹⁰³

The third of these provisions, 35 U.S.C. § 102(f), states that a person may obtain a patent unless “he did not himself invent the subject matter sought to be patented.” This proposed amendment would not alter the requirement that only an actual inventor may obtain a patent, which is also stated by 35 U.S.C. § 101.¹⁰⁴

Inventor’s Oath and Assignee Filing

Under current U.S. law, a patent application must be filed by the inventor—that is, the natural person or persons who developed the invention.¹⁰⁵ This rule applies even where the invention was

¹⁰⁴ See Schechter & Thomas, *supra*, at § 4.4.4. This amendment may potentially alter the holding in *Oddzon Products Inc. v. Just Toys Inc.*, 122 F.3d 1396 (Fed. Cir. 1997), that subject matter that qualifies as prior art only under 35 U.S.C. § 102(f) may be used for a nonobviousness analysis under 35 U.S.C. § 103(a). Further discussion of this issue may be found at CRS Report RL33063, *Intellectual Property and Collaborative Research*, by John R. Thomas.

¹⁰⁵ 35 U.S.C. § 111.

developed by individuals in their capacity as employees. Even though rights to the invention have usually been contractually assigned to an employer, for example, the actual inventor, rather than the employer, must be the one that applies for the patent. In particular, Section 115 of the Patent Act obliges each applicant must also submit an oath or declaration stating that he believes himself to be the “original and first inventor” of the subject matter for which he seeks a patent. Section 118 of the Patent Act allows a few exceptions to this general rule. If an inventor cannot be located, or refuses to perform his contractual obligation to assign an invention to his employer, then the employer may file the patent application in place of the inventor.

S. 515 and S. 610 would have modified these rules by incorporating the exceptions found in current Section 118 into Section 115 of the Patent Act.¹⁰⁶ This proposal appears to be primarily technical in nature, although a few changes between the proposed statute and present law exist. First, S. 515 required inventors to declare only that they are the “original inventor”—rather than the “original and first inventor”—in keeping with the proposed shift to a first-inventor-to-file priority system. Second, S. 515 allowed an “individual who is under an obligation of assignment for patent [to] include the required statements ... in the assignment executed by the individual, in lieu of filing such statements separately.” This provision comports with the allowance of the filing of patent applications by employers and other assignees of patent rights.

S. 515 further stipulated that a “person to whom the inventor has assigned or is under an obligation to assign the invention may make an application for patent.”¹⁰⁷ Individuals who otherwise make a showing of a “sufficient proprietary interest in the matter” may also apply for a patent on behalf of the inventor upon a sufficient show of proof of the pertinent facts. Under S. 515, if the USPTO “Director grants a patent on an application filed under this section by a person other than the inventor, the patent shall be granted to the real party in interest and upon such notice to the inventor as the Director considers to be sufficient.”

H.R. 1260 also introduced a number of changes to existing Section 115 of the Patent Act, but does not amend Section 118. Like its counterpart in the Senate, H.R. 1260 would have allowed an “individual who is under an obligation of assignment for patent [to] include the required statements ... in the assignment executed by the individual, in lieu of filing such statements separately.”¹⁰⁸

Legal reforms allowing assignee filing of patent applications have been discussed for many years. Two well-known commissions encouraged this shift, albeit some years ago. A 1966 Report of the President’s Commission on the Patent System recommended the allowance of assignee filing as a way to simplify formalities of application filing and to avoid delays caused by the need to identify and obtain signatures from each inventor.¹⁰⁹ The 1992 Advisory Commission on Patent Law Reform was also in favor of this change. The 1992 commission observed that the United States was “the only country which does not permit the assignee of an invention to file a patent application in its own name.”¹¹⁰ In the opinion of the 1992 commission, assignee filing would

appropriately accompany a U.S. shift to a first-inventor-to-file priority system, as the reduction of formalities would allow innovative enterprises to file patent applications more promptly.

The 1992 commission also explained that adoption of assignee filing may have some negative consequences. The commission noted that patent applications filed by assignees may lack the actual inventor's personal guarantee that the application was properly prepared. In addition, assignee filing might derogate the right of natural persons to their inventions. In the opinion of the commission, however, the advantages of assignee filing outweighed the disadvantages.¹¹¹

Damages

H.R. 1260, S. 515, and S. 610 each addressed monetary remedies in patent cases. Marketplace realities often render the determination of an appropriate damages award a difficult affair in patent litigation. In some cases, the product or process that is found to infringe may incorporate numerous additional elements beyond the patented invention. For example, the asserted patent may relate to a single component of an audio speaker, while the accused product consists of the entire stereo system. In such circumstances, a court may apply "the entire market value rule," which "permits recovery of damages based upon the entire apparatus containing several features, where the patent-related feature is the basis for consumer demand."¹¹² On the other hand, if the court determines that the infringing sales were due to many factors beyond the use of the patented invention, the court may apply principles of "apportionment" to measure damages based upon the value of the patented feature alone.¹¹³

Some observers believe that courts have sometimes been overly generous in assessing damages in patent cases. As one commentator asserted:

[B]road application of the entire market value rule appears to broaden the practical scope of a remedy for patent infringement beyond the legal scope of the patent and despite careful attention to a precise and proper construction of claim terms. Further, although the entire market value rule was conceived to ensure a proper level of damages for the infringement by recognizing a patent's value that went beyond sales of a single product, the courts' abandonment of a meaningful "basis of consumer" demand test requires an infringer to pay damages for an entire system, despite that the patent has been issued on only a narrow piece that has little market impact on sales of unpatented components. Similarly, failing to provide subsequent inventors with clear notice of their potential liability by uneven application of the entire market value rule may chill innovation and interfere with the public notice requirements on which the patent laws depend. Overcompensating initial inventors and over-detering subsequent inventors interferes with the balance sought to be struck by proper claim interpretation.¹¹⁴

Other commentators disagree, believing that current case law appropriately incorporates apportionment principles. These commentators also believe that the proposed reforms would diminish the value of the patent right to the detriment of the innovation environment of the United States. One observer states:

¹¹¹ *Id.*

¹¹² *State Indus., Inc. v. Mor-Flo Indus., Inc.*, 883 F.2d 1573, 1580 (Fed. Cir. 1989).

¹¹³ *Dowagiac Mfg. Co. v. Minn. Moline Plow Co.*, 235 U.S. 641 (1915).

¹¹⁴ Amy L. Landers, "Let the Games Begin: Incentives to Innovation in the New Economy of Intellectual Property Law," 46 *Santa Clara Law Review* (2006), 364-65.

Courts have had little difficulty applying the current law on apportionment and the entire market value rule to reach just and reasonable findings on assessment of damages....

Patent infringement damages ... are the culmination of the courts' long and careful efforts to adhere to the statutory requirement to provide damages adequate to compensate for the infringement of an inventor's patent. Apportionment recognizes the reality that consumer demand for an infringing product or process may in part spring from contributions from the infringer, and to reward the inventor for those contributions is inappropriate. On the other hand, the entire market value rule recognizes the reality that even complex assemblies may owe their marketability to a patented feature—a feature that drives consumer demand for the overall assembly. In those cases, it is entirely appropriate to reward the inventor according to the worth of her invention. To do otherwise would only encourage those who trespass and discourage inventors from making their intellectual efforts available to the public. The courts can be and are flexible in assessing each case on its merits, and they can reliably determine the correct royalty base and rate that will award “damages adequate to compensate for the infringement.”¹¹⁵

In brief, H.R. 1260 called for a court to select one of the following methods for determining a “reasonable royalty” as the measure of damages: (1) the economic value that is properly attributable to the patented invention's specific contribution over the prior art, (2) the entire market value rule, or (3) other factors, such as terms of the nonexclusive marketplace licensing of the invention.¹¹⁶ The House bill also stipulated that courts may receive expert testimony as an aid to the determination of the appropriate royalty.

In contrast, S. 515 did not expressly address apportionment and the entire market value rule. It instead required courts to “identify the methodologies and factors that are relevant to the determination of damages” and to consider only that subject matter when assessing damages.¹¹⁷ Litigants are afforded an opportunity to request that the court consider whether a party's damages contentions lack “a legally sufficient evidentiary basis.” S. 515 also provided that “sequencing,” or separate trials of substantive and remedial issues, shall be permitted “absent good cause to reject such a request.”

The reforms proposed by S. 610 were also procedural and evidentiary in nature. It instead allows courts to “consider any factors that are relevant to the determination of a reasonable royalty.”¹¹⁸ However, S. 610 stipulated that the amount of royalties paid for patents other than the patent subject to litigation may only be considered in particular circumstances, and further that the financial condition of the infringer is not relevant to the reasonable royalty determination. S. 610 also required damages experts who intend to present testimony to provide data and other information from which they draw their conclusions, and also mandates that trial judges determine whether such testimony is based upon legally sufficient evidence before allowing it to be considered by a jury.

Views differ on the appropriateness of this reform. Some believe that current damages standards have resulted in the systemic overcompensation of patent owners. Such overcompensation may

¹¹⁵ William C. Rooklidge, “Reform of the Patent Laws: Forging Legislation Addressing Disparate Interests,” 88 *Journal of the Patent and Trademark Office Society* (2006), 17-18, 20 (quoting 35 U.S.C. § 284).

¹¹⁶ H.R. 1260, § 5(a).

¹¹⁸ S. 610, § 4(a).

place unreasonable royalty burdens upon producers of high technology products, ultimately impeding the process of technological innovation and dissemination that the patent system is meant to foster. Others believe that current case law appropriately accounts for apportionment concerns. These observers are concerned that this reform might overly restrict damages in patent cases, thereby discouraging voluntary licensing and promoting infringement of patent rights. Limited damage awards for patent infringement might prevent innovators from realizing the value of their inventive contributions, a principal goal of the patent system.

Willful Infringement

H.R. 1260 and S. 515 proposed to reform the law of willful infringement. The patent statute currently provides that the court “may increase the damages up to three times the amount found or assessed.”¹¹⁹ An award of enhanced damages, as well as the amount by which the damages will be increased, is committed to the discretion of the trial court. Although the statute does not specify the circumstances in which enhanced damages are appropriate, the Federal Circuit recently explained that “a patentee must show by clear and convincing evidence that the infringer acted despite an objectively high likelihood that its actions constituted infringement of a valid patent.”¹²⁰ This circumstance is termed “willful infringement.”¹²¹

Courts will not ordinarily enhance damages due to willful infringement if the adjudicated infringer did not know of the patent until charged with infringement in court, or if the infringer acted with the reasonable belief that the patent was not infringed or that it was invalid. Prior to the 2007 decision in *In re Seagate Technology*, Federal Circuit decisions emphasized the duty of someone with actual notice of a competitor’s patent to exercise due care in determining if his acts will infringe that patent.¹²² In *Seagate Technology*, however, the Federal Circuit opted to “abandon the affirmative duty of due care.”¹²³ The court of appeals instead explained that “proof of willful infringement permitting enhanced damages requires at least a showing of objective recklessness.”¹²⁴

Prior to 2004, the Federal Circuit held that when an accused infringer invoked the attorney-client or work-product privilege, courts should be free to reach an adverse inference that either (1) no opinion had been obtained or (2) an opinion had been obtained and was contrary to the infringer’s desire to continue practicing the patented invention.¹²⁵ However, in its decision in *Knorr-Bremse Systeme fuer Nutzfahrzeuge GmbH v. Dana Corp.*,¹²⁶ the Federal Circuit expressly overturned this principle. The Court of Appeals further stressed that the failure to obtain legal advice did not occasion an adverse inference with respect to willful infringement either. Following the *Knorr-Bremse* opinion, willful infringement determinations are based upon “the totality of

circumstances, but without the evidentiary contribution or presumptive weight of an adverse inference that any opinion of counsel was or would have been unfavorable.”¹²⁷

Patent law’s willful infringement doctrine has proven controversial. Some observers believe that this doctrine ensures that patent rights will be respected in the marketplace. Critics of the policy believe that the possibility of trebled damages discourages individuals from reviewing issued patents. Out of fear that their inquisitiveness will result in multiple damages, innovators may simply avoid looking at patents until they are sued for infringement. To the extent this observation is correct, the law of willful infringement discourages the dissemination of technical knowledge, thereby thwarting one of the principal goals of the patent system. Fear of increased liability for willful infringement may also discourage firms from challenging patents of dubious validity. Consequently some have argued that the patent system should shift to a “no-fault” regime of strictly compensatory damages, without regard to the state of mind of the adjudicated infringer.¹²⁸

H.R. 1260 and S. 515 would have added several clarifications and changes to the law of willful infringement. Under H.R. 1260, a finding of willful infringement would be appropriate only where (1) the infringer received specific written notice from the patentee and continued to infringe after a reasonable opportunity to investigate; (2) the infringer intentionally copied from the patentee with knowledge of the patent; or (3) the infringer continued to infringe after an adverse court ruling. In addition, willful infringement cannot be found where the infringer possessed an informed, good faith belief that its conduct was not infringing. Finally, a court may not determine willful infringement before the date on which the court determines that the patent is not invalid, enforceable, and infringed.¹²⁹

S. 515 stipulated that infringement is not willful unless “the claimant proves by clear and convincing evidence that the accused infringer’s conduct with respect to the patent was objectively reckless.” Knowledge of the patent, by itself, does not constitute willful infringement. Damages may not be increased if there is a close case as to infringement, validity, or enforceability.¹³⁰ S. 610 did not address willful infringement.

Prior User Rights

The “first inventor defense” established by the American Inventors Protection Act of 1999 would have been broadened by H.R. 1260 and S. 515. As currently found at 35 U.S.C. § 273, an earlier inventor of a “method of doing or conducting business” that was later patented by another may claim a defense to patent infringement in certain circumstances. This legislation proposes to allow the defense to apply as well to affiliates of the entity that qualifies for the defense.

The existing “first inventor defense” accounts for the complex relationship between the law of trade secrets and the patent system. Trade secrecy protects individuals from misappropriation of valuable information that is useful in commerce. One reason an inventor might maintain the invention as a trade secret rather than seek patent protection is that the subject matter of the

¹²⁷ *Ibid* at 1341.

¹²⁸ See generally Schechter & Thomas, *supra*, at § 9.2.5.

¹²⁹ H.R. 1260, § 5(c).

¹³⁰ S. 515, § 4(a).

invention may not be regarded as patentable. Such inventions as customer lists or data compilations have traditionally been regarded as amenable to trade secret protection but not to patenting.¹³¹ Inventors might also maintain trade secret protection due to ignorance of the patent system or because they believe they can keep their invention as a secret longer than the period of exclusivity granted through the patent system.¹³²

The patent law does not favor trade secret holders, however. Well-established patent law provides that an inventor who makes a secret, commercial use of an invention for more than one year prior to filing a patent application at the USPTO forfeits his own right to a patent.¹³³ This policy is based principally upon the desire to maintain the integrity of the statutorily prescribed patent term. The patent law grants patents a term of twenty years, commencing from the date a patent application is filed.¹³⁴ If the trade secret holder could make commercial use of an invention for many years before choosing to file a patent application, he could disrupt this regime by delaying the expiration date of his patent.

On the other hand, settled patent law principles established that prior secret uses would not defeat the patents of later inventors.¹³⁵ If an earlier inventor made secret commercial use of an invention, and another person independently invented the same technology later and obtained patent protection, then the trade secret holder could face liability for patent infringement. This policy is based upon the reasoning that once issued, published patent instruments fully inform the public about the invention, while trade secrets do not. As between a subsequent inventor who patented the invention, and thus had disclosed the invention to the public, and an earlier trade secret holder who had not, the law favored the patent holder.

An example may clarify this rather complex legal situation. Suppose that Inventor A develops and makes commercial use of a new manufacturing process. Inventor A chooses not to obtain patent protection, yet maintains that process as a trade secret. Many years later, Inventor B independently develops the same manufacturing process and promptly files a patent application claiming that invention. In such circumstances, Inventor A's earlier, trade secret use does not prevent Inventor B from procuring a patent. Furthermore, if the USPTO approves the patent application, then Inventor A faces infringement liability should Inventor B file suit against him.

The American Inventors Protection Act of 1999 modified this principle.¹³⁶ That statute in part provided an infringement defense for an earlier inventor of a "method of doing or conducting business" that was later patented by another. By limiting this defense to patented methods of doing business, Congress responded to the 1998 Federal Circuit opinion in *State Street Bank and Trust Co. v. Signature Financial Group*.¹³⁷ That judicial opinion recognized that business methods could be subject to patenting, potentially exposing individuals who had maintained business methods as trade secrets to liability for patent infringement.

¹³¹ Restatement of Unfair Competition § 39.

¹³⁴ 35 U.S.C. § 154.

¹³⁵ *W.L. Gore & Associates v. Garlock, Inc.*, 721 F.2d 1540 (Fed. Cir. 1983).

¹³⁶ The American Inventors Protection Act of 1999, P.L. 106-113, was part of the Intellectual Property and Communications Omnibus Reform Act of 1999, attached by reference to the Consolidated Appropriations Act for Fiscal Year 2000. President Clinton signed this bill on November 29, 1999.

¹³⁷ 149 F.3d 1368 (Fed. Cir. 1998).

Again, an example may aid understanding of the first inventor defense. Suppose that Inventor X develops and exploits commercially a new method of doing business. Inventor X maintains his business method as a trade secret. Many years later, Inventor Y independently develops the same business method and promptly files a patent application claiming that invention. Even following the enactment of the American Inventors Protection Act, Inventor X's earlier, trade secret use would not prevent Inventor Y from procuring a patent. However, should the USPTO approve Inventor Y's patent application, and should Inventor Y sue Inventor X for patent infringement, then Inventor X may potentially claim the benefit of the first inventor defense. If successful,¹³⁸ Inventor X would enjoy a complete defense to infringement of Inventor Y's patent.

H.R. 1260 and S. 515 would have expanded the first inventor defense as it was established in 1999. The defense currently applies to "the person who performed the acts necessary to establish the defense..."¹³⁹ Both bills also allowed "any other entity that controls, is controlled by, or is under common control" with that person to claim entitlement to the first inventor defense.¹⁴⁰ S. 610 did not address the first inventor defense.

Marking

The Patent Act encourages patent proprietors that manufacture their patented inventions to notify the public of their patent rights. Section 287(a) provides that patent owners should place the word "patent," or the abbreviation "pat.," along with the number of the patent, on patented goods. If the nature of the article does not allow this notice to be placed directly upon it, then a label may be placed on the article or its packaging. This practice is commonly termed "marking."¹⁴¹

There is no absolute duty to mark. If a patent proprietor fails to mark in the specified manner, however, then it may receive damages only for infringing acts that occur after the infringer receives actual notice of infringement.¹⁴² Filing an infringement lawsuit is considered to provide such actual notice. Less severely, a patent owner may issue a specific charge of infringement, commonly by sending a cease and desist letter to the infringer. The marking statute is said "to give patentees the proper incentive to mark their products and thus place the world on notice of the existence of the patent."¹⁴³

The marking statute does not apply in some situations. Obviously, if the patent owner does not sell products that embody the patented invention, then there is no obligation to mark. In addition, "[t]he law is clear that the notice provisions of section 287 do not apply where the patent is directed to a process or method."¹⁴⁴ Because these types of patent concern inchoate behavior,

¹³⁸ As presently codified at 35 U.S.C. § 273, the first inventor defense is subject to a number of additional qualifications. First, the defendant must have reduced the infringing subject matter to practice at least one year before the effective filing date of the application. Second, the defendant must have commercially used the infringing subject matter prior to the effective filing date of the patent. Finally, any reduction to practice or use must have been made in good faith, without derivation from the patentee or persons in privity with the patentee.

¹³⁹ 35 U.S.C. § 273(b)(6).

¹⁴⁰ H.R. 1260, § 5(c); S. 515, § 4(c).

¹⁴¹ See Schechter & Thomas, *supra*, at § 9.2.3.

¹⁴² It should be further appreciated that under 35 U.S.C. § 286, "no recovery shall be had for any infringement committed more than six years prior to the filing of the complaint or counterclaim for infringement in the action."

¹⁴³ *Laitram Corp. v. Hewlett-Packard Co.*, 806 F. Supp. 1294, 1296 (E.D. La. 1992).

¹⁴⁴ *American Med. Sys., Inc. v. Medical Eng'g Corp.*, 6 F.3d 1523, 1538 (Fed. Cir. 1993).

rather than a discrete physical product, the courts have reasoned that there is no tangible item on which to place a patent marking.¹⁴⁵

The Patent Act also addresses the issue of “false marking.” Section 292 prohibits marking a product with the number of another’s patent, the name of another patent owner, or a patent or application number where no such patent or application exists. Prohibited marks also include the number of expired patents and patents that do not cover the marked product, provided such marks were affixed for the “purpose of deceiving the public.”

The Patent Act calls for a maximum fine of \$500 for “every such” offense. According to the statute, “any person may sue for the penalty, in which event one-half shall go to the person suing and the other to the use of the United States.”¹⁴⁶ In its December 29, 2009, decision in *The Forest Group, Inc. v. Bon Tool Co.*,¹⁴⁷ the Federal Circuit construed that provision to require imposition of that fine with respect to each item that was falsely marked. In so doing the Court of Appeals specifically rejected an interpretation that would assess the fine on the basis of the offender’s single decision to mark an entire line of products. A false patent marking on 1 million identical products would therefore generate a maximum fine of not \$500, but rather \$500 million. Although the Federal Circuit acknowledged that “interpreting the fine of § 292 to apply on a per article basis would encourage ‘a new cottage industry’ of false marking litigation by plaintiffs who have not suffered any direct harm,” the court explained “that in the case of inexpensive mass-produced articles, a court has the discretion to determine that a fraction of a penny per article is a proper penalty.”¹⁴⁸

S. 515 amended section 287(a) to allow for “virtual marking.” Under this proposal, the marking standard would be fulfilled if the product or its packaging included the word “patent” or the abbreviation “pat.,” together with an Internet address that provided the number of the patent associated with the patented article.¹⁴⁹ Neither H.R. 1260 nor S. 610 had similar provisions.

In addition, S. 515 would have altered the Patent Act’s false marking provision by stipulating that the statute may only be privately enforced by a “person who has suffered a competitive injury as a result of the violation....”¹⁵⁰ This amendment would change current law, which allows any person may bring a civil action for false marking, whether or not they have been negatively affected. Neither H.R. 1260 nor S. 610 had similar provisions.

Citation of Prior Art

The ability of members of the public to cite to the USPTO information that may be pertinent to the validity of a granted patent would have been augmented by both H.R. 1260 and S. 515. Section 301 of the Patent Act currently allows any person at any time to cite “patents or printed publications” that person believes “have a bearing on the patentability of any claim of a particular

¹⁴⁵ See *State Contracting & Eng’g Corp. v. Condotte Am., Inc.*, 346 F.3d 1057, 1074 (Fed. Cir. 2003).

¹⁴⁶ 35 U.S.C. § 292(b). This sort of proceeding is termed a *qui tam* action.

¹⁴⁷ 590 F.3d 1295 (Fed. Cir. 2009).

¹⁴⁸ *Ibid.* at 1303-04.

¹⁴⁹ S. 515, § 4(d).

¹⁵⁰ S. 515, § 2(k).

patent.”¹⁵¹ That person may also optionally include a written statement explaining his views. The USPTO then places these “prior art citations” in the patent’s official file, where they are accessible to the public. The name of the person who files a prior art citation may be kept confidential by request.

H.R. 1260 and S. 515 expanded the sorts of documents that may be cited under section 301. Each would allow the citation of written statements that the patent owner has filed before a federal court or the USPTO regarding the scope of the patent’s claims.¹⁵² H.R. 1260 would have allowed citation of “documentary evidence that the claimed invention was in public use or sale in the United States more than 1 year prior to the date of the application for patent in the United States”; in contrast, S. 515 would have permitted “prior art consisting of patents or printed publications [believed] to have a bearing on the patentability of any claim of a particular patent.”¹⁵³ S. 610 did not address prior art citations with respect to issued patents.

Post-Grant Review Proceedings

Legislation introduced in the 111th Congress would have established post-grant review proceedings in U.S. patent law. Post-grant review proceedings, which are common in foreign patent regimes, are patent revocation procedures usually administered by authorities from the national patent office. Typically known as “oppositions,” these procedures often involve a wide range of potential invalidity arguments and are conducted through adversarial hearings that resemble courtroom litigation.¹⁵⁴

Although the U.S. patent system does not currently include full-fledged post-grant review proceedings in the manner of an opposition, the U.S. patent system has incorporated a so-called reexamination proceeding since 1981. Under the reexamination statute, any individual, including the patentee, a competitor, and even the USPTO Director, may cite a prior art patent or printed publication to the USPTO. If the USPTO determines that this reference raises a “substantial new question of patentability” with respect to an issued patent, then it will essentially reopen prosecution of the issued patent.

Traditional reexamination proceedings are conducted in an accelerated fashion on an *ex parte* basis. Following the American Inventors Protection Act of 1999,¹⁵⁵ an *inter partes* reexamination allows the requester to participate more fully in the proceedings through the submission of arguments and the filing of appeals. Either sort of reexamination may result in a certificate confirming the patentability of the original claims, an amended patent with narrower claims or a declaration of patent invalidity.

¹⁵¹ 35 U.S.C. § 301.

¹⁵² S. 515, § 5(g). H.R. 1260 would also allow citation of such patent owner statements made before the U.S. International Trade Commission in proceedings under section 337 of the Tariff Act of 1930. H.R. 1260, § 6(a).

¹⁵³ H.R. 1260, § 6(a); S. 515, § 5(g).

¹⁵⁴ See CRS Report R40378, *The Design and Implementation of Patent Revocation Proceedings: Innovation Issues*, by John R. Thomas.

¹⁵⁵ The American Inventors Protection Act of 1999, P.L. 106-113, was part of the Intellectual Property and Communications Omnibus Reform Act of 1999, attached by reference to the Consolidated Appropriations Act for Fiscal Year 2000. President Clinton signed this bill on November 29, 1999.

Congress intended reexamination proceedings to serve as an inexpensive alternative to judicial determinations of patent validity.¹⁵⁶ Reexamination also allows further access to the legal and technical expertise of the USPTO after a patent has issued.¹⁵⁷ However, some commentators believe that reexamination proceedings have been employed only sparingly and question their effectiveness.¹⁵⁸

H.R. 1260, S. 515, and S. 610 each proposed a new revocation procedure termed a “post-grant review proceeding.” H.R. 1260 provided that any person other than the patent proprietor may commence this proceeding. It may begin either within 12 months of the date the patent was issued or at any time if the patent proprietor so consents. The patent involved in the post-grant review proceeding does not enjoy a presumption of validity. Rather, “the party advancing a proposition ... shall have the burden of proving that proposition by a preponderance of the evidence.”¹⁵⁹

S. 515 would have allowed a person who is not the patent owner to file a petition requesting post-grant review within nine months after a patent issues or reissues. The petitioner bears the burden of proving a proposition of unpatentability by a preponderance of the evidence.¹⁶⁰

Under S. 610, a “post-grant review proceeding” may be instituted by “a person who has a substantial economic interest adverse to a patent.”¹⁶¹ S. 610 established a “first-period proceeding,” brought within nine months after the grant of the patent, or a “second-period proceeding” brought thereafter. First-period proceedings may address a broader range of patentability issues than second-period proceedings. In addition, the presumption of validity accorded to a patent in a first-period proceeding must be overcome by a preponderance of the evidence, while in a second-period proceeding the burden is the higher threshold of clear and convincing evidence.

Each of the three bills afforded the patent proprietor a single opportunity to amend its patent during the proceeding, with further opportunities available with good cause shown. The USPTO would be required to reach a final decision within one year of commencement of the proceeding, with an extension possible of up to six months for good cause shown. Should the patent survive the post-grant review proceeding, the individual who commenced the proceeding, along with his privies, are barred in the future from raising issues that were previously aired before the USPTO; S. 515 extended the scope of this estoppel to issues that were “raised or reasonably could have been raised.” The three bills also provided the USPTO Director with authority to establish regulations to govern post-grant review proceedings.

These three bills also proposed amendments to the existing reexamination procedures. Under H.R. 1260, one of these changes appeared to respond to concerns that potential requesters are discouraged from commencing *inter partes* reexamination proceedings due to a statutory provision that limits their future options. In order to discourage abuse of these proceedings, the *inter partes* reexamination statute provided that third-party participants may not later assert that a

¹⁵⁹ H.R. 1260, § 6(b).

¹⁶⁰ S. 515, § 5(d).

¹⁶¹ S. 610, § 5(c).

patent is invalid “on any ground that [they] raised or could have raised during the *inter partes* reexamination proceedings.”¹⁶² Some observers believed that this potential estoppel effect disinclines potential requesters from use of this post-issuance proceeding. Possibly in reaction to this perceived problem, H.R. 1260 would have deleted the phrase “or could have raised” from the statute.¹⁶³ As a result, *inter partes* reexamination requesters would be limited only with respect to arguments that they actually made before the USPTO.

S. 515 also would have altered *inter partes* reexamination, renaming the procedure “*inter partes* review.” While *inter partes* reexamination may now be requested at any time during the life of the patent, an *inter partes* review must be brought within nine months of the date a patent is issued or reissued. Further, although the USPTO currently faces no time limit for completing an *inter partes* reexamination, an *inter partes* review must be completed within one year of commencement of the proceeding, with an extension possible of up to six months for good cause shown.¹⁶⁴ In contrast, S. 610 eliminated *inter partes* reexamination proceedings entirely.¹⁶⁵

Many observers have called for the United States to adopt a more effective post-grant administrative revocation system in order to provide more timely, lower cost, and more efficient review of issued patents.¹⁶⁶ Such a system could potentially improve the quality of issued patents by weeding out invalid claims. It might also encourage innovative firms to review issued patents soon after they are granted, thereby increasing the opportunity for technology spillovers.¹⁶⁷ However, concerns have arisen over oppositions because they too may be costly, complex, and prone to abuse as a means for harassing patent owners.¹⁶⁸ A successful post-grant review proceeding will require a balancing of these issues.

Pre-Issuance Submissions

The ability of members of the public to submit information to the USPTO that is pertinent to pending applications would have been augmented by each of the three bills. Under current law, interested individuals may enter a protest against a patent application. The protest must specifically identify the application and be served upon the applicant. The protest must also include a copy and, if necessary, an English translation, of any patent, publication, or other information relied upon. The protester also must explain the relevance of each item.¹⁶⁹

Protest proceedings have traditionally played a small role in U.S. patent practice. Until Congress enacted the American Inventors Protection Act of 1999, the USPTO maintained applications in secrecy. Therefore, the circumstances in which members of the public would learn of the precise contents of a pending patent application were relatively limited. With the USPTO commencing publication of some pending patent applications, protests would seem far more likely. Seemingly

¹⁶⁷ *Ibid.* at 103.

¹⁶⁸ See Mark D. Janis, “Rethinking Reexamination: Toward a Viable Administrative Revocation System for U.S. Patent Law,” 11 *Harvard Journal of Law and Technology* (1997), 1.

¹⁶⁹ 37 C.F.R. § 1.291.

aware of this possibility, the 1999 act provided that the USPTO shall “ensure that no protest or other form of pre-issuance opposition ... may be initiated after publication of the application without the express written consent of the applicant.”¹⁷⁰ Of course, the effect of this provision is to eliminate the possibility of protest in exactly that class of cases where the public is most likely to learn of the contents of a pending application.

Through rulemaking, the USPTO has nonetheless established a limited mechanism for members of the public to submit information they believe is pertinent to a pending, published application. The submitted information must consist of either a patent or printed publication, and it must be submitted within two months of the date the USPTO published the pending application. Nondocumentary information that may be relevant to the patentability determination, such as sales or public use of the invention, will not be considered.¹⁷¹ In addition, because Congress stipulated that no protest or pre-grant opposition may occur absent the consent of the patent holder, the USPTO has explained that it will not accept *comments* or *explanations* concerning the submitted patents or printed publications. If such comments are attached, USPTO staff will redact them before the submitted documents are forwarded to the examiner.¹⁷²

The proposed legislation from the 111th Congress would have expanded the possibility for pre-issuance submissions. Under all three bills, any person may submit patent documents and other printed publications to the USPTO for review. Such prior art must be submitted within the later date of either (1) the date the USPTO issues a notice of allowance to the patent applicant; or (2) either six months after the date of pre-grant publication of the application, or the date of the first rejection of any claim by the USPTO examiner. Such a submission must include “a concise description of the asserted relevance of each submitted document.”¹⁷³

Most observers agree that ideally, the USPTO should have access to all pertinent information when making patentability determinations. A more expansive pre-issuance submission policy may allow members of the public to disclose relevant patents and other documents that the USPTO’s own searchers may not have revealed, thereby leading to more accurate USPTO decision making. On the other hand, lengthy pre-issuance submissions may merely be repetitive of the USPTO’s own search results, but still require extensive periods of examiner review that might ultimately delay examination. The proposals attempted to balance these concerns by expanding existing opportunities for post-publication submissions, but limiting the timing and nature of those submissions so as to prevent undue burdens upon the USPTO and patent applicants.

Venue

Each of the three bills would have reformed the venue provision that applies to patent infringement cases in federal court.¹⁷⁴ The requirement of venue complements the more fundamental requirement of jurisdiction in federal litigation. The venue statute provides for which

¹⁷⁰ 35 U.S.C. § 122(c).

¹⁷¹ 37 C.F.R. § 1.99.

¹⁷² U.S. Dept. of Commerce, U.S. Patent & Trademark Off., Manual of Patent Examining Procedure § 1134.01 (8th ed. July 2008).

¹⁷³ H.R. 1260, § 9; S. 515, § 7; S. 610, § 7.

¹⁷⁴ In addition, each bill would alter the venue of suits where the USPTO is a party from the District Court for the District of Columbia to the District Court for the Eastern District of Virginia. H.R. 1260, § 10(c); S. 515, § 8(c); S. 610, § 10(c).

court, out of those that possess personal and subject matter jurisdiction, may most conveniently hear the specific lawsuit in question.¹⁷⁵

Congress has enacted a specialized venue statute that applies only to patent cases. 28 U.S.C. § 1400(b) provides that in patent litigation, venue is proper either (1) in the judicial district where the defendant resides, or (2) where the defendant has committed acts of infringement and has a regular and established place of business. An important question under this provision is where a corporation is deemed to “reside.” Prior to 1988, a corporation was viewed as residing in its state of incorporation.¹⁷⁶ Commentators have explained that during this period, the patent venue statute was fairly restrictive, tending to move infringement litigation into the defendant’s seat of operations.¹⁷⁷

Congressional amendments subsequently liberalized venue concepts in patent litigation. In 1988, Congress adopted a new definition of “reside” as it applies to venue for corporate defendants.¹⁷⁸ Under the new definition, a corporation is presumed to reside in any judicial district to which it could be subject to personal jurisdiction at the time the litigation commences. Congress codified this change in a separate provision found at 28 U.S.C. § 1391. Although there is no evidence that Congress contemplated that these reforms would hold consequences for the specialized patent venue statute, the Federal Circuit nonetheless held that this amendment should also be read into § 1400(b).¹⁷⁹

The result of the 1988 amendments has been significant for corporate defendants, which constitute the majority of defendants in patent litigation. Although § 1400(b) still governs venue in patent cases, few if any plaintiffs rely upon the restrictive second prong of that section. Instead they base venue upon the “residence” requirement of the first prong—which now is entirely coterminous with personal jurisdiction, and which for larger corporations is likely to include every federal district in the country. For corporate defendants, then, the venue statute has essentially become superfluous, for the same standards governing personal jurisdiction also dictate whether a court may provide an appropriate venue or not.

Some observers allege that the liberal venue statute promotes forum shopping, allowing patent proprietors to bring suit in courts that they believe favor patent owners over accused infringers. One such “magnet jurisdiction” is said to be the rural Eastern District of Texas, and in particular the Marshall, TX, federal court. According to one account, many observers “wonder how an East Texas town of 25,000—even if it was named after Supreme Court Justice John Marshall—came to harbor an oversized share of intellectual property disputes.”¹⁸⁰ In addition, reportedly “many of the local lawyers who once specialized in personal injury cases are turning their attention to intellectual property law.”¹⁸¹ Others believe that the existence of a single appellate court for patent cases, the Federal Circuit, minimizes forum shopping concerns, and that certain district

¹⁸¹ *Ibid.*

courts attract patent cases due to their expertise and timeliness, rather than an inherent favoritism for patent holders.¹⁸²

H.R. 1260 and S. 610 generally called for venue to exist (1) where the defendant has its principal place of business, (2) where the defendant has committed a substantial portion of its acts of infringement and has an established physical facility, (3) if the plaintiff is an institution of higher education, individual, or small business, the plaintiff's residence, or (4) the place of the plaintiff's established physical facility devoted to research, development, or manufacturing.¹⁸³ In addition, H.R. 1260 stipulated that "a party shall not manufacture venue by assignment, incorporation, or otherwise to invoke the venue of a specific district court."

S. 515 did not present new substantive rules for venue for patent cases. Rather, it succinctly provides that "[f]or the convenience of parties and witnesses, in the interest of justice, a district court shall transfer any civil action arising under any Act of Congress relating to patents upon a showing that the transferee venue is clearly more convenient than the venue in which the civil action is pending."¹⁸⁴

Interlocutory Claim Construction Appeals

The bills introduced in the 111th Congress would have allowed a litigant to pursue an interlocutory appeal¹⁸⁵ of a patent claim construction order to the Court of Appeals for the Federal Circuit. This provision appears to be motivated by the recognition that the interpretation of a patent claims—a process that in large measure determines the scope of the patent owner's proprietary rights—is the most fundamental inquiry that occurs during patent litigation.¹⁸⁶ In addition, numerous observers have perceived the Federal Circuit to have a high reversal rate of claim interpretations by the district courts.¹⁸⁷ Because claim construction is commonly the central focus of a patent trial, the Federal Circuit's reversal of that construction often requires the district court to retry the entire case. As patent litigation is a notoriously lengthy and costly exercise, some observers believe that the current system is overly expensive and inefficient.¹⁸⁸

Some commentators have opined that allowing an immediate appeal of patent claim construction orders would allow Federal Circuit review before the litigants are put to the full expense of a trial in federal district court.¹⁸⁹ Ordinarily, litigants may appeal only "final decisions" from the district

¹⁸² See Xuan-Thao Nguyen, "Justice Scalia's 'Renegade Jurisdiction': Lessons for Patent Law Reform," 83 *Tulane Law Review* (2008), 111.

¹⁸³ H.R. 1260, § 10(a); S. 610, § 8(a).

¹⁸⁴ S. 515, § 8(a).

¹⁸⁵ An "interlocutory appeal" is an appeal that occurs before the trial court's final ruling on the entire case. See 28 U.S.C. § 1292(b) (2006). In this context, the interlocutory appeal concerning claim construction issues would occur before the court decides additional issues, such as whether there has been an infringement and the amount of damages to be awarded to the patent owner.

¹⁸⁶ See Joseph Scott Miller, "Enhancing Patent Disclosure for Faithful Claim Construction," 9 *Lewis & Clark Law Review* (2005), 177.

courts.¹⁹⁰ Although federal law currently allows for a review of an intermediate matter at trial¹⁹¹—a so-called interlocutory appeal—the Federal Circuit has declined to accept such appeals for routine claim interpretation cases.¹⁹² H.R. 1260 would have expressly authorized such interlocutory appeals.¹⁹³ Neither Senate bill addressed this issue.

Not everyone agrees that routine allowance of interlocutory appeals of claim construction orders would expedite patent litigation. In a letter of June 13, 2007, addressed to Senators Patrick Leahy and Arlen Specter, Federal Circuit Chief Judge Paul Michel stated that should this provision be enacted, “I would expect an interlocutory appeal in virtually every patent infringement case as soon as a claim construction order issues.”¹⁹⁴ In his view, this situation would lead to “extended delays” that “would be intolerable from the standpoint of corporate litigants.”¹⁹⁵

USPTO Fee-Setting Authority

Under current law, the USPTO enjoys certain rulemaking authority. The USPTO may establish regulations that “govern the conduct of proceedings” before it, for example, as well as regulations that “govern the recognition and conduct” of patent attorneys.¹⁹⁶ H.R. 1260, S. 515, and S. 610 each proposed that the USPTO be granted the authority “to set or adjust by rule any fee established or charged by the Office” under certain provisions of the patent and trademark laws.¹⁹⁷ This proposal appeared to provide the USPTO with greater flexibility to adjust its fee schedule absent congressional intervention.

Under current law, patent applicants that qualify as “small entities” are entitled to a 50% discount of many USPTO fees. S. 515 also would have established a “micro entity” category of applicants. A micro entity must make a certification that it qualifies as a small entity, has not been named on five previously filed patent applications, has not conveyed an interest in the application to another, and does not have a gross income exceeding 2.5 times the average gross income.¹⁹⁸ Micro entities would be entitled to a 75% fee discount.¹⁹⁹

Residency of Federal Circuit Judges

Under current law, each Federal Circuit jurist must “reside within fifty miles of the District of Columbia” while in active service.²⁰⁰ Both H.R. 1260 and S. 515 proposed to eliminate this requirement.²⁰¹ This issue was not included in S. 610.

Liberalization of the residency requirement would potentially broaden the pool of individuals eligible for service on the Federal Circuit. This reform may also be appropriate for a court that enjoys jurisdiction over patent appeals that arise across the United States.²⁰² No other federal appellate court is subject to a similar residency requirement.²⁰³ On the other hand, because the Federal Circuit courthouse is located in Washington, DC, the current residency rule might promote greater interaction among its jurists.

USPTO Travel Expenses Test Program

S. 515 required the USPTO to conduct a test program under which the agency would pay the expenses of certain employees for travel to and from a USPTO worksite.²⁰⁴ Such payments would be contingent upon the employee entering into an approved telework arrangement, the employee teleworks from a location beyond the local commuting area of the USPTO, and the USPTO approves the arrangement for reasons of employee convenience, rather than an agency need for the employee to relocate in order to perform duties specific to the new location. The test program would be designed to enhance cost savings or other efficiencies that accrue to the government. H.R. 1260 and S. 610 did not include a similar provision.

Best Mode

Currently, inventors are required to “set forth the best mode contemplated by the inventor of carrying out his invention.”²⁰⁵ Failure to disclose the best mode known to the inventor is a ground for invalidating an issued patent. The courts have established a two-part standard for analyzing whether an inventor disclosed her best mode in a particular patent. The first inquiry was whether the inventor knew of a way of practicing the claimed invention that she considered superior to any other. If so, then the patent instrument must identify, and disclose sufficient information to enable persons of skill in the art to practice that best mode.²⁰⁶

Proponents of the best mode requirement have asserted that it allows the public to receive the most advantageous implementation of the technology known to the inventor. This disclosure becomes part of the patent literature and may be freely reviewed by those who wish to design around the patented invention. Absent a best mode requirement, some observers say, patent

²⁰⁶ *See, e.g., Chemcast Corp. v. Arco Industries Corp.* 913 F.2d 923 (Fed. Cir. 1990).

proprietors may be able to maintain the preferred way of practicing their inventions as a trade secret. Members of the public are also said to be better able to compete with the patentee on equal footing after the patent expires.²⁰⁷

The best mode requirement has been the subject of ongoing discussion in recent years, however.²⁰⁸ For example, a 1992 Presidential Commission recommended that Congress eliminate the best mode requirement. The commission reasoned that patents also are statutorily required to disclose “the manner and process of making and using [the invention], in such full, clear, concise, and exact terms as to enable any person skilled in the art ... to make and use the same.”²⁰⁹ This “enablement” requirement was believed to provide sufficient information to achieve the patent law’s policy goals.²¹⁰

The commission further stated that the best mode requirement leads to increases in the costs and complexity of patent litigation. As the commission explained:

The disturbing rise in the number of best mode challenges over the past 20 years may serve as an indicator that the best mode defense is being used primarily as a procedural tactic. A party currently can assert failure to satisfy the best mode requirement without any significant burden. This assertion also entitles the party to seek discovery on the “subjective beliefs” of the inventors prior to the filing date of the patent application. This broad authority provides ample opportunity for discovery abuse. Given the fluidity by which the requirement is evaluated (e.g., even accidental failure to disclose any superior element, setting, or step can negate the validity of the patent), and the wide ranging opportunities for discovery, it is almost certain that a best mode challenge will survive at least initial judicial scrutiny.²¹¹

The commission further reasoned that the best mode at the time of filing is unlikely to remain the best mode when the patent expires many years later.²¹² Because many foreign patent laws include no analog to the best mode requirement, inventors based overseas have also questioned the desirability of the best mode requirement in U.S. law.

S. 515 would have continued to apply the best mode requirement to all patents. However, it would no longer form the basis for a defense to a charge of patent infringement during enforcement litigation or post-grant review proceedings.²¹³ Compliance with the best mode requirement would remain subject to review by USPTO examiners during the initial prosecution of a patent, although USPTO rejection of applications based upon failure to comply with the best mode requirement is reportedly a rare circumstance.²¹⁴ Neither H.R. 1260 nor S. 610 addressed this issue.

District Court Pilot Program

Although the concept of a district court pilot program appeared in S. 515,²¹⁵ it was also introduced in discrete legislation as H.R. 628. After passage by both the House and Senate, the bill was signed into law as P.L. 111-349 on January 4, 2011. This legislation established a pilot program that will be implemented in a total of six district courts—three with at least 10 district judges, and three with fewer than 10 district judges. Each of those courts must either be (1) one of the top 15 district courts for filed patent lawsuits or (2) have adopted, or certified an intention to adopt, local rules for patent cases. The director of the Administrative Office of the United States Courts is authorized to designate the six courts participating in the pilot program.

Under this program, (1) the chief judge of the court designates district judges who request to hear cases involving patent or plant variety protection issues; (2) such cases are randomly assigned to district court judges, whether designated or not; (3) a non-designated judge may decline the case; and (4) a declined case is then randomly reassigned to a designated judge. The law calls for the submission of reports to Congress analyzing the effectiveness of the program.

Applicant Quality Submissions

Under current law, inventors who file a patent application at the USPTO are required to disclose earlier patents, journal articles, and other prior art references of which they are aware, and that they believe are material to the determination of whether their invention should be patented or not.²¹⁶ However, patent applicants are not required affirmatively to conduct a literature search in order to identify relevant prior art references.²¹⁷ Although some inventors probably complete a prior art search as a matter of due diligence prior to preparing and filing a patent application, this effort is not obligatory. As part of the prosecution process, USPTO examiners conduct literature searches in order to identify the prior art that most closely relates to the claimed invention.

S. 610 would have allowed the USPTO Director to “offer incentives to applicants who submit a search report, a patentability analysis, or other information relevant to patentability.”²¹⁸ Such incentives may include modifications to fees or “prosecution flexibility.” S. 610 further stipulates that such submissions may not be admitted in court as an aid to construction of the patent in certain circumstances. Neither H.R. 1260 nor S. 515 addressed this issue.

Inequitable Conduct

The administrative process of obtaining a patent from the USPTO has traditionally been conducted as an *ex parte* procedure. Stated differently, patent prosecution involves only the applicant and the USPTO. Members of the public, and in particular the patent applicant’s marketplace competitors, do not participate in patent acquisition procedures.²¹⁹ As a result, the

²¹⁵ S. 515, § 16. In addition to patent cases, cases under the Plant Variety Protection Act, Pub. L. No. 91-577, Dec. 24, 1970, 84 Stat. 1542-1559, are also covered by the pilot program. No similar provision was found in H.R. 1260 or S. 610.

²¹⁶ 37 C.F.R. § 1.56.

²¹⁷ Schechter & Thomas, *supra*, at § 7.2.1.

²¹⁸ S. 610, § 10.

²¹⁹ 35 U.S.C. § 122(a) (stating the general rule that “applications for patents shall be kept in confidence by the Patent (continued...)”).

patent system relies to a great extent upon applicant observance of a duty of candor and truthfulness towards the USPTO.

An applicant's obligation to proceed in good faith may be undermined, however, by the great incentive applicants might possess not to disclose, or to misrepresent, information that might deleteriously impact her prospective patent rights. The patent law therefore penalizes those who stray from honest and forthright dealings with the USPTO. Under the doctrine of "inequitable conduct," if an applicant intentionally misrepresents a material fact or fails to disclose material information, then the resulting patent will be declared unenforceable.²²⁰ Two elements must exist before a court will decide that the applicant has engaged in inequitable conduct. First, the patentee must have misrepresented or failed to disclose material information to the USPTO in the prosecution of the patent.²²¹ Second, such nondisclosure or misrepresentation must have been intentional.²²²

During patent infringement litigation, an accused infringer has the option of asserting that the plaintiff's patent is unenforceable because it was procured through inequitable conduct. Some observers have expressed concerns that charges of inequitable conduct have become routine in patent cases. As one commentator explains:

The strategic and technical advantages that the inequitable conduct defense offers the accused infringer make it almost too attractive to ignore. In addition to the potential effect on the outcome of the litigation, injecting the inequitable conduct issue into patent litigation wreaks havoc in the patentee's camp. The inequitable conduct defense places the patentee on the defensive, subjects the motives and conduct of the patentee's personnel to intense scrutiny, and provides an avenue for discovery of attorney-client and work product documents....²²³

As the Federal Circuit put it, "the habit of charging inequitable conduct in almost every major patent case has become an absolute plague."²²⁴ Other observers believe that because inequitable conduct requires an analysis of the knowledge and intentions of the patent applicants, the doctrine may also be contributing disproportionately to the time and expense of patent litigation.²²⁵

Due to these perceived burdens upon patent litigation, some commentators have proposed that the inequitable conduct defense be eliminated.²²⁶ Others believe that inequitable conduct is necessary to ensure the proper functioning of the patent system. As the Advisory Commission on Patent Law Reform explained in its 1992 report:

(...continued)

²²⁶ Lynch, *supra*, at 7.

Some mechanism to ensure fair dealing between the patentee, public, and the Federal Government has been part of the patent system for over 200 years. In its modern form, the unenforceability defense provides a necessary incentive for patent applicants to engage in fair and open dealing with the [USPTO] during the ex parte prosecution of patent applications, by imposing the penalty of forfeiture of patent rights for failure to so deal. The defense is also considered to be an essential safeguard against truly fraudulent conduct before the [USPTO]. Finally, the defense provides a means for encouraging complete disclosure of information relevant to a particular patent application.... Thus, from a policy perspective, the defense of unenforceability based upon inequitable conduct is desirable and should be retained.²²⁷

S. 610 proposed to remove determinations of inequitable conduct from the courts entirely, instead obligating the USPTO Director to promulgate regulations for “receiving and reviewing information indicating that parties to a matter or proceeding before the Office may have engaged in misconduct in connection with such matter or proceeding.” Punishable behavior was defined as “misconduct consisting of intentionally deceptive conduct of a material nature in connection with a matter or proceeding before the Office.” The Director may levy civil penalties of up to \$150,000 for each act of misconduct, with exceptional misconduct allowing a penalty of up to \$10 million. The USPTO’s determination may be appealed to the Federal Circuit. Neither H.R. 1260 nor S. 515 addressed this issue.

Supplemental Examination

S. 515 would have permitted patent owners to request a “supplemental examination” in order to “consider, reconsider, or correct information believed to be relevant to the patent.”²²⁸ If the USPTO Director believes that this information raises a substantial new question of patentability, then a reexamination will be ordered. S. 515 provided that a “patent shall not be held unenforceable ... on the basis of conduct relating to information that had not been considered, was inadequately considered, or was incorrect in a prior examination of the patent if the information was considered, reconsidered, or corrected during a supplemental examination of the patent.” The supplemental examination request and resulting reexamination must be concluded prior to the start of litigation for the patent to obtain this benefit.

The proposed supplemental examination serves a similar goal as the existing reissue procedure—correction of an issued patent that may be inoperative or invalid.²²⁹ A significant distinction between supplemental examination and reissue is that the latter proceeding only applies to patents that are defective due to an “error without any deceptive intention.” As a result, patent proprietors must identify an error, such as the existence of a highly relevant journal article that qualifies as prior art, in order to reissue a patent. In addition, reissue may not be used to rehabilitate a patent that was procured through inequitable conduct.²³⁰ In contrast, supplemental examination is not limited to situations where an error occurred. The proposed proceeding would also allow a patent that had been acquired through inequitable conduct to be rendered enforceable under the stipulated conditions. Neither H.R. 1260 nor S. 610 addressed this issue.

Conversion of Deadlines

Under current law, many deadlines for submissions to the USPTO or to the courts are expressed in terms of a period of days. For example, certain patent owners eligible for an extension of patent term must petition the USPTO within 60 days of the grant of the patent.²³¹ S. 610 would have converted a number of these deadlines from their current, daily basis to a monthly basis.²³² Under this proposal, a 30-day deadline would become a one-month deadline, a 60-day deadline would become a two-month deadline, and a 90-day deadline would become a three-month deadline, and a 180-day deadline would become a six-month deadline. No comparable provision appeared in H.R. 1260 or S. 515.

Check Imaging Patents

S. 610 proposed to limit the remedies available for patent infringement with respect to a “financial institution” that uses a “check collection system.”²³³ In particular, in such circumstances the patentee is not eligible to receive damages, attorney fees, or an injunction. S. 610 further stipulated that if this provision “is found to establish a taking of private property for public use without just compensation, this [provision] shall be null and void.” No similar language was included in the other two bills.

USPTO Funding

S. 610 would have addressed the collection of fees by the USPTO, as well as the disposition of such fees. USPTO funding largely derives from the fees it charges to patent and trademark applicants, as well as other entities that interact with the agency.²³⁴ Congress has not always allocated all of the fees that the USPTO collected towards the operation of that agency. Reportedly over \$750 million in USPTO fees were directed towards other government operations.²³⁵

S. 610 established a “USPTO Revolving Fund” consisting of fees deposited with the USPTO. The amount deposited in the fund would in turn be available for the USPTO to spend in support of that agency’s operations. The USPTO would be responsible for notifying the House and Senate Appropriation Committees of its funds and expenditures.²³⁶ Neither H.R. 1260 nor S. 515 addressed this issue.

²³⁶ S. 610, § 14.

Required Studies

H.R. 1260 and S. 515 required the USPTO to undertake and complete new studies with respect to prior user rights.²³⁷ In addition, H.R. 1260 mandated that the USPTO complete studies over varying time frames with respect to the following topics: (1) if consummated, the effect on a switch to a first-inventor-to-file priority system,²³⁸ (2) damages,²³⁹ and (3) reexamination proceedings.²⁴⁰ H.R. 1260 would have further obligated the Administrative Office of the United States Courts to complete a study regarding the use of special masters in U.S. courts,²⁴¹ and also required the Comptroller General to complete a study on workplace conditions at the USPTO.²⁴² In contrast, S. 515 required the USPTO to complete a report on the results of the travel expenditure test program²⁴³ and also obligated to Director of the Administrative Office of the United States Courts to submit a report regarding the district court pilot program.²⁴⁴ S. 610 did not mandate the completion of any studies.

Other Possible Reforms

Reforms pertaining to a number of additional patent law doctrines were discussed in previous sessions of Congress, but were not incorporated within either S. 515 or H.R. 1260. This report reviews a number of these topics in the event that consideration of these reforms is renewed in the 112th Congress. In so doing this report refers to two bills considered in the 110th Congress, S. 1145 and H.R. 1908, both known as the Patent Reform Act of 2007. S. 1145 was reported out of the Senate Committee on the Judiciary on January 28, 2008, while H.R. 1908 passed the House of Representatives on September 7, 2007.

Late USPTO Filings

In the 110th Congress, S. 1145 would have allowed the USPTO Director to accept filings in patent and trademark matters made after the applicable statutory deadline, provided that the tardy applicant “files a petition within 30 days after such deadline showing, to the satisfaction of the Director, that the delay was unintentional.”²⁴⁵ Both the patent and trademark statutes require the individual to complete certain filings by specified time limits in order to obtain intellectual property rights, object to rights granted to others, or for other reasons.²⁴⁶ These statutes often, but not always, provide for USPTO acceptance of late filings upon a special showing by the applicant.²⁴⁷ S. 1145 appeared to provide a general statutory provision for late filings that would

supplement the current, more narrowly targeted provisions. No analogous provision appeared in H.R. 1908.

Publication of Pending Applications

Until recent years, the U.S. patent system did not disclose pending patent applications. The first moment that the public would become aware of the existence of a U.S. patent application was the day the USPTO formally allowed it to issue as a granted patent. This regime advantaged patent applicants because it allowed them to understand exactly what the scope of any allowed claims might be prior to disclosing an invention. Thus, if the applicant was able to maintain the invention that was subject to a patent application as a trade secret, then he could choose between obtaining the allowed patent claims and trade secret status. In addition, because the invention was not disclosed prior to the award of formal patent rights, unscrupulous competitors were discouraged from copying the invention.

However, this secrecy regime has been perceived as imposing costs as well. Others might well engage in duplicative research efforts during the pendency of patent applications, unaware that an earlier inventor had already staked a claim to that technology. This arrangement also allowed inventors to commence infringement litigation on the very day a patent issued, without any degree of notice to other members of the technological community.²⁴⁸

Industry in the United States possessed one mechanism for identifying pending U.S. patent applications. Most foreign patent regimes publish all pending patent applications approximately 18 months after they have been filed.²⁴⁹ As a result, savvy firms in the United States could review pending applications filed before foreign patent offices, and make an educated guess as to the existence of a corresponding U.S. application. This effort was necessarily inexact, however, particularly as some inventors either lacked the resources, or made the strategic decision, not to obtain patent rights outside the United States.

In enacting the American Inventors Protection Act of 1999,²⁵⁰ Congress for the first time introduced the concept of pre-grant publication into U.S. law. Since November 29, 2000, U.S. patent applications have been published 18 months from the date of filing, with some exceptions. The most significant of these exceptions applies where the inventor represents that he will not seek patent protection abroad. In particular, if an applicant certifies that the invention disclosed in the U.S. application will not be the subject of a patent application in another country that requires publication of applications 18 months after filing, then the USPTO will not publish the application.²⁵¹ As a result, inventors who do not wish to seek foreign patent rights retain the possibility of avoiding pre-grant publication.

In the 110th Congress, H.R. 1908 and S. 1145 would have further modified the U.S. pre-grant publication system, but would have done so in different ways. Under S. 1145, all pending

²⁵¹ 35 U.S.C. § 122(b).

applications would have been published approximately 18 months after they were filed. Under H.R. 1908, domestic-only applications would have been published “three months after a second [USPTO] office action” or 18 months after filing, whichever is the later date.²⁵² The House bill would have apparently allowed the applicant some time to assess whether the USPTO would grant a patent with claims of satisfactory scope prior to disclosing the invention publicly. As a result, although both bills would have eliminated the possibility of opting out of pre-grant publication by certifying that a patent will be sought only in the United States, the precise timing of the publication of those applications potentially differed.²⁵³

Tax Planning Method Patents

In recent years, the USPTO has issued patents on financial, investment, and other methods that individuals might use in order to minimize their tax obligations.²⁵⁴ The so-called “SOGPAT” patent, U.S. Patent No. 6,567,790, has been identified as one such “tax planning method” patent. The SOGPAT patent is titled “[e]stablishing and managing grantor retained annuity trusts funded by nonqualified stock options.” The patent’s abstract explains that it concerns:

An estate planning method for minimizing transfer tax liability with respect to the transfer of the value of stock options from a holder of stock options to a family member of the holder. The method comprises establishing a Grantor Retained Annuity Trust (GRAT) funded with nonqualified stock options. The method maximizes the transfer of wealth from the grantor of the GRAT to a family member by minimizing the amount of estate and gift taxes paid. By placing the options outside the grantor’s estate, the method takes advantage of the appreciation of the options in said GRAT.

Tax planning method patents have been the subject of a spirited debate.²⁵⁵ Some observers believe that such patents negatively impact social welfare. According to some experts, tax planning method patents may limit the ability of taxpayers to utilize provisions of the tax code, interfering with congressional intent and leading to distortions in tax obligations.²⁵⁶ Others assert that tax planning method patents potentially complicate legal compliance by tax professionals and taxpayers alike.²⁵⁷ Still others believe that the patent system should not provide incentives for individuals to develop new ways to reduce their tax liability.²⁵⁸

²⁵² The term “office action” refers to a USPTO examiner’s official communication with a patent applicant. *See* 35 U.S.C. § 132.

Some commentators explain that patents concerning the broader category of “business methods” have been obtained and enforced for many years.²⁵⁹ Legislation enacted in 1999 that accounted expressly for patents claiming “a method of doing or conducting business” arguably approved of such patents.²⁶⁰ In addition, some observers believe that tax planning method patents present a positive development, potentially improving the public disclosure of tax shelters for the attention of Congress and federal tax authorities.²⁶¹ They also assert that many kinds of patents, on subject matter ranging from automobile seat belts to airplane navigation systems, potentially involve legal compliance.²⁶²

In the 110th Congress, H.R. 1908 proposed to introduce language into the Patent Act stipulating that “[a] patent may not be obtained for a tax planning method.”²⁶³ No analogous provision appeared in S. 1145.

Concluding Observations

Legislation introduced in the 111th Congress arguably would have worked the most sweeping reforms to the U.S. patent system since the 19th century. However, many of these proposals, such as pre-issuance publication, prior user rights, and oppositions, have already been implemented in U.S. law to a more limited extent. These and other proposed modifications, such as the first-inventor-to-file priority system and elimination of the best mode requirement, also reflect the decades-old patent practices of Europe, Japan, and our other leading trading partners. As well, many of these suggested changes enjoy the support of diverse institutions, including the Federal Trade Commission, National Academies, economists, industry representatives, attorneys, and legal academics.

Other knowledgeable observers are nonetheless concerned that certain of these proposals would weaken the patent right, thereby diminishing needed incentives for innovation. Some also believe that changes of this magnitude, occurring at the same time, do not present the most prudent course for the patent system. Patent reform therefore confronts Congress with difficult legal, practical, and policy issues, but also with the apparent possibility for altering and potentially improving the legal regime that has long been recognized as an engine of innovation within the U.S. economy.
